COMIRNATY (COVID-19 mRNA VACCINE)
RISK MANAGEMENT PLAN

RMP Version number: 4.0

Data lock point for this RMP: See below

12-15 years of age	13 March 2021 (Pfizer Clinical Database) 18 June 2021 (Pfizer Safety Database)
16 years and older	23 October 2020 (BioNTech Clinical Database) 13 March 2021 (Pfizer Clinical Database) 18 June 2021 (Pfizer Safety Database)
5 to < 12 years of age	06 September 2021 (Pfizer Clinical Database) 18 June 2021 (Pfizer Safety Database)

Date of final sign off: 25 November 2021

Rationale for submitting an updated RMP (v 4.0): This Type II variation includes an updated Comirnaty EU RMP that merges versions 2.5 and 3.0:

- Rationale for submitting an updated RMP (v 2.5): This Type II variation includes an updated Comirnaty EU RMP that merges versions 2.3 (myocarditis/pericarditis) and 2.4 (tris-sucrose adult formulation). The updated EU RMP v 2.5 was submitted on 12 November 2021.

- Rationale for submitting an updated RMP (v 3.0): This Type II variation supports extension of the indication to children 5 to <12 years of age. Following receipt of the PRAC Rapporteur's preliminary assessment report and the Request for Supplementary Information on 16 November 2021, with regard to the RMP v 3.0 submitted in October 2021 (procedure number EMEA/H/C/005735/X/0077), an updated draft added non-interventional post-approval safety studies that include paediatric subject aged 5 to < 12 years old, as requested. The updated EU RMP v 3.0 was submitted on 19 November 2021.

Summary of significant changes in this RMP:

RMP Part/Module	Major Change (s)	
	RMP v 3.0	**RMP v 2.5**
PART I PRODUCT(S) OVERVIEW	Change to include the new paediatric population aged 5 to < 12-year-old	Addition of data related to the tris-sucrose adult formulation
PART II SAFETY SPECIFICATION		
PART II.Module SI Epidemiology of the Indication(s) and Target Populations	Change to include the new paediatric population aged 5 to < 12-year-old	No changes made
PART II.Module SII Non-Clinical Part of the Safety Specification	No changes made.	No changes made
PART II.Module SIII Clinical Trial Exposure	Change to include the new paediatric population aged 5 to < 12-year-old	No changes made
PART II.Module SIV Populations Not Studied in Clinical Trials	Change to include the new paediatric population aged 5 to < 12-year-old	No changes made
PART II.Module SV Post-Authorisation Experience	No changes made.	No changes made.
PART II.Module SVI Additional EU Requirements for the Safety Specification	No changes made.	No changes made.
PART II.Module SVII Identified and Potential Risks	Change to include the new paediatric population aged 5 to < 12-year-old	No changes made
PART II.Module SVIII Summary of the Safety Concerns	No changes made.	No changes made.
PART III PHARMACOVIGILANCE PLAN (INCLUDING POST AUTHORISATION SAFETY STUDIES)		
III.1 Routine Pharmacovigilance activities III.2 Additional Pharmacovigilance Activities and III.3 Summary Table of Additional Pharmacovigilance Activities	Addition of data related to the new paediatric population aged 5 to < 12-year-old and of tri/sucrose paediatric formulation Removal of study C4591018 Milestone for study C4591024 updated Inclusion of new protocol number C4591030 Non-interventional post-approval safety studies updated to include paediatric subjects aged 5 to < 12 years old Inclusion of study C4591007 Milestone changed for study C4591001	Addition of data related to the tris-sucrose adult formulation
PART IV PLANS FOR POST AUTHORISATION EFFICACY STUDIES	No changes made.	No changes made.
PART V RISK MINIMISATION MEASURES (INCLUDING EVALUATION OF THE EFFECTIVENESS OF RISK MINIMISATION ACTIVITIES)		

RMP Part/Module	Major Change (s)	
	RMP v 3.0	**RMP v 2.5**
V.1 Routine Risk Minimisation Measures V.2 Additional Risk Minimisation Measures V.3 Summary of Risk Minimisation Measures	Addition of data related to the new paediatric population aged 5 to < 12-year-old Inclusion of study C4591007	No changes made.
PART VI SUMMARY OF THE RISK MANAGEMENT PLAN		
I The Medicine and What It Is Used For II Risks Associated With the Medicine and Activities to Minimise or Further Characterise the Risks	Addition of data related to the new paediatric population aged 5 to < 12-year-old Non-interventional post-approval safety studies updated to include paediatric subjects aged 5 to < 12 years old Inclusion of study C4591007 Milestone changed for study C4591001	No changes made.
PART VII ANNEXES TO THE RISK MANAGEMENT PLAN	Annex 2: Studies/milestones updated Annex 3. Studies updated Annex 8: Changes to reflect the updates	Annex 8: Changes to reflect the updates

TABLE OF CONTENTS

LIST OF TABLES

LIST OF FIGURES

PART I. PRODUCT(S) OVERVIEW

Active substance(s) (INN or common name)	Tozinameran is single-stranded, 5'-capped messenger RNA (mRNA) produced using a cell-free *in vitro* transcription from the corresponding DNA templates, encoding the viral spike (S) protein of SARS-CoV-2.
Pharmacotherapeutic group(s) (ATC Code)	J07BX03
Marketing Authorisation Applicant	BioNTech Manufacturing GmbH
Medicinal products to which this RMP refers	1
Invented name(s) in the European Economic Area (EEA)	Comirnaty
Marketing authorisation procedure	Centralised
Brief description of the product:	Chemical class Nucleoside-modified messenger RNA is formulated in LNP
	Summary of mode of action The nucleoside-modified messenger RNA in Comirnaty is formulated in LNPs, which enable delivery of the non replicating RNA into host cells to direct transient expression of the SARS-CoV-2 S antigen. The vaccine elicits both neutralizing antibody and cellular immune responses to the spike (S) antigen, which may contribute to protection against COVID-19.
	Important information about its composition Comirnaty: – is nucleoside-modified messenger RNA formulated in LNPs; – is a white to off-white frozen dispersion (pH:6.9 – 7.9). - Excipients for 30 micrograms/dose concentrate for dispersion for injection (PBS-Sucrose): • ((4-hydroxybutyl)azanediyl)bis(hexane-6,1-diyl)bis(2-hexyldecanoate) (ALC-0315) • 2-[(polyethylene glycol)-2000]-N,N-ditetradecylacetamide (ALC-0159) • 1,2-Distearoyl-sn-glycero-3-phosphocholine (DSPC) • cholesterol, • potassium chloride, • potassium dihydrogen phosphate, • sodium chloride, • disodium phosphate dihydrate, • sucrose, • water for injections.

	- Excipients for 30 micrograms/dose dispersion for injection (Tris-Sucrose): • ALC-0315 • ALC-0159 • DSPC • cholesterol • trometamol • trometamol hydrochloride • sucrose • water for injections. - Excipients for 10 micrograms/dose concentrate for dispersion for injection, Children 5 to 11 years (Tris-sucrose): • ALC-0315 • ALC-0159 • DSPC • cholesterol • trometamol • trometamol hydrochloride sucrose • water for injections The Tris-sucrose formulation is based on the current approved vaccine except that the formulation buffer has been changed from phosphate buffered saline to Tris buffer without sodium chloride and potassium chloride while maintaining the same target pH.
Hyperlink to the Product Information:	Please refer to Module 1.3.1 of this submission
Indication in the EEA	Current: Active immunisation to prevent COVID-19 caused by SARS-CoV-2 virus, in individuals 5 years of age and older.

Dosage in the EEA	Current PBS-Sucrose Adults and adolescent from 12 years: 30 micrograms/dose concentrate for dispersion for injection is administered intramuscularly after dilution as a course of 2 doses (0.3 mL each) at least 21 days apart. Current Tris-sucrose Adults and adolescent from 12 years: 30 micrograms/dose dispersion for injection is administered intramuscularly as a course of 2 doses (0.3 mL each) at least 21 days apart. Children 5 to 11 years: 10 micrograms/dose concentrate for dispersion for injection is administered intramuscularly after dilution as a course of 2 doses (0.2 mL each). It is recommended to administer the second dose 3 weeks after the first dose.
Pharmaceutical form and strengths	Current PBS-Sucrose Adults and adolescent from 12 years: 30 micrograms/dose concentrate for dispersion for injection (Purple cap). After dilution each vial contains 6 doses of 0.3 mL Current Tris-sucrose Adults and adolescent from 12 years: 30 micrograms/dose dispersion for injection (Grey cap): One vial (2.25 mL) contains 6 doses of 0.3 mL. The drug product does not require dilution for administration. Children 5 to 11 years: 10 micrograms/dose concentrate for dispersion for injection (Orange cap). After dilution each vial contains 10 doses of 0.2 mL
Is/will the product be subject to additional monitoring in the EU?	Yes

PART II. SAFETY SPECIFICATION

Module SI. Epidemiology of the Indication(s) and Target Population (s)

Indication

Active immunisation to prevent COVID-19 caused by SARS-CoV-2 virus, in individuals-5 years of age and older**.**

Incidence:

The coronavirus disease of 2019 (COVID-19) is caused by a novel coronavirus labelled as SARS-CoV-2. The disease first emerged in December 2019, when a cluster of patients with pneumonia of unknown cause was recognised in Wuhan City, Hubei Province, China.[1] The number of infected cases rapidly increased and spread beyond China throughout the world. On 30 January 2020, the WHO declared COVID-19 a Public Health Emergency of International Concern and thus a pandemic.[2]

Estimates of SARS-CoV-2 incidence change rapidly. The MAH obtained incidence and prevalence estimates using data from Worldometer, a trusted independent organisation that collects COVID-19 data from official reports and publishes current global and country-specific statistics online.[3]

As of 15 August 2021, the overall number of people who had been infected with SARS-CoV-2 was over 207 million worldwide[4], an increase of 92 million in the 5 months since 03 March 2021[5]. Table 1 shows the incidence and prevalence as of 15 August 2021 for the US, UK, and EU-27 countries. In the EU and the UK, by 15 August 2021 the total number of confirmed cases had accumulated to 41 million people, or 8,074 per 100,000 people (from 27 million, or 5,226 per 100,000 by 03 March 2021). Across countries in the EU, the number of confirmed cases ranged from 2,118 to 15,620 cases per 100,000 people. Finland and Germany reported the lowest incidence rates while Czech Republic, Slovenia, and Luxembourg reported the highest. [4]

In the US, the number of confirmed cases had reached over 37 million cases (11,236 per 100,000 people) by 15 August 2021.[4] This is an increase from 29 million (8,864 per 100,000) by 03 March 2021.[5]

Table 1. Incidence, Prevalence, and Mortality of COVID-19 as of 15 August 2021[4]

	Total Cases	Incidence: Total Cases/100,000	Active Cases	Prevalence: Active Cases/ 100,000	Total Deaths	Mortality: Deaths / 100,000	Population

The reported numbers refer to cases that have been tested and confirmed to be carrying the virus and sometimes, depending upon the country, also presumptive, suspect, or probable cases of detected infection. There are large geographic variations in the proportion of the population tested as well as in the quality of reporting across countries. People who carry the virus but remain asymptomatic are less likely to be tested and therefore mild cases are likely underreported. The numbers should therefore be interpreted with caution.[6]

Prevalence:

The prevalence of SARS-CoV-2 infection is defined as active cases per 100,000 people including confirmed cases in people who have not recovered or died. On 15 August 2021, the overall prevalence estimates for the EU and UK were 449 and 1,923 active cases per 100,000, respectively, [4] compared to approximately 1,500 per 100,000 for both the EU and UK on 03 March 2021[5]. The range of reported prevalence was 15 to 1,544 per 100,000: Slovakia, Romania, and Czech Republic reported the lowest prevalence while Spain, Cyprus, and Finland reported the highest (Table 1).

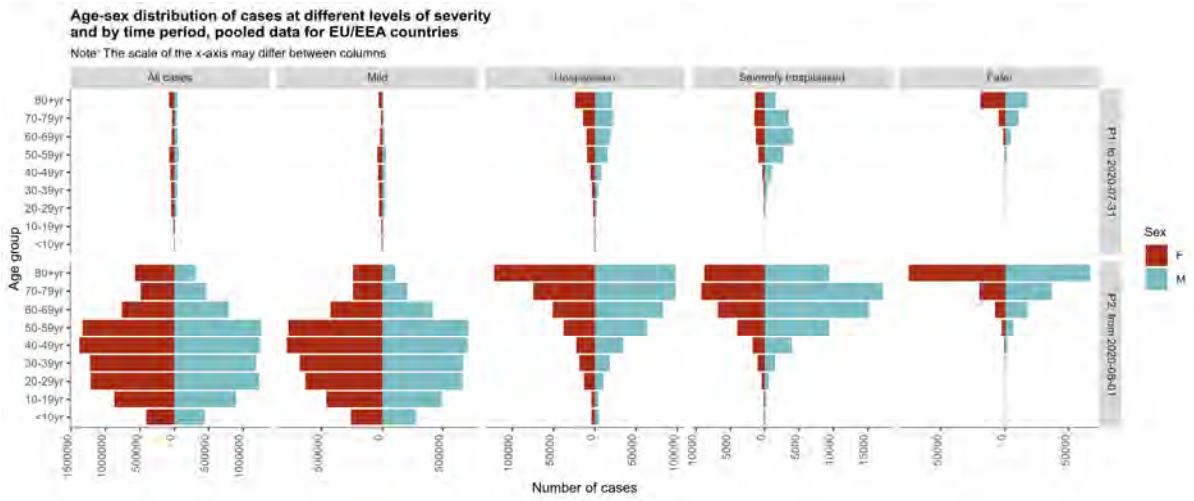
In the US, the prevalence on 15 August 2021 was similar to UK 1,997 active cases per 100,000[4]. This is a decrease of approximately 700 per 100,000 since 03 March 2021, when the prevalence was 2,685 per 100,000[5].

Demographics of the population in the proposed indication and risk factors for the disease:

Since the beginning of the pandemic, the ECDC has continuously collected COVID-19 information from all EU/EEA member states. In the ECDC's TESSy database, COVID-19 case-based data, including age and gender, are available for over 80% of the official number of cases reported by ECDC epidemic intelligence[7], enabling estimates of age and gender distribution representative of the European population. TESSy data on age and sex distributions by severity of symptoms as posted on 12 August 2021 are shown in Figure 1.[8]

The top half of the figure represents data ending on 31 July 2020 and the bottom half presents data from 01 August 2020 to 08 August 2021 (Figure 1). In general, the age-sex patterns before 01 August 2020 have remained the same since then. The gender distribution of persons testing positive for SARS-CoV-2 in the European population is similar for most age groups. Cases reported in TESSy have been older than the general population throughout the pandemic, with few cases observed in people aged younger than 20 years. This likely reflects the age distribution of people who met the requirements for being tested and is unlikely to reflect the actual distribution of infections in the population. Those with severe outcomes (hospitalised, severely hospitalised [admitted to intensive care and/or required respiratory support], or fatal) have been disproportionately older and male compared to COVID-19 cases overall. While age-sex patterns have remained consistent throughout the pandemic, a notable difference between the periods before and since 01 August 2020 is that the absolute numbers of cases have increased dramatically in the latter period compared to the earlier one.

Figure 1. Age-Sex distribution of COVID-19 Cases as Different Levels of Severity, Pooled data for EU/EEA countries. Case-based Data from TESSy produced on 12 August 2021[a]



Note: "mild" = a case that has not been reported as hospitalized or a case that resulted in death.

a. Data from ECDC. COVID-19 Surveillance report. Week 31, 2021. 12 August 2021. "2.2 Age-sex pyramids" Accessed 15 August 2021.

US distributions of COVID cases and deaths by age, sex, and race, as well as the cross-tabulation of age and sex, are shown in Table 2 as of 14 August 2021[9]. At that time, the CDC reported that the US had recorded a total of 36,556,516 cases of COVID and 618,591 deaths attributable to the disease. However, because demographic data were not available for all US COVID cases and deaths, the numbers in Table 2 and Table 3 are drawn, respectively, from 29,346,352 cases and 513,204 deaths. Those under age 50 account for 67% of all cases but approximately for only 5% of deaths. For ages 18-74, males account for less than half of cases but over 60% of deaths. Among the paediatric population, there is close to a 50-50 case distribution between males and females across ages 0-17. However, the paediatric mortality distribution is highly irregular between the sexes, with males being 51.5% of COVID deaths among 0-4-year-old, 55.9% among 5-11-year-old, 46.7% among 12–15-year-old, and 68.7% among 16-17-year-old.

Table 2. Distribution of Cases (n=29,346,352) by Age, Sex, Race, and Cross-Tabulated Age and Sex - United States[9] as of 14 August 2021[a]

a. Percentage of missing demographic data varied by types of event and demographic.
b. Except for Hispanics/Latinos, all categories refer to non-Hispanics
Abbreviations: AI/AN=American Indian/Alaska Native, H/L=Hispanic/Latino, M/O=Multiple/Other, NH/PI=Native Hawaiian/Other Pacific Islander

In general, disease has been much less severe among ages 0-24 compared to ages ≥25 years, with 2.5% hospitalised, 0.8% admitted to an intensive care unit, and <0.1% dying among ages 0-24, versus 16.6% hospitalised, 8.6% intensive care, and 5% dying among ages ≥25 years.[10] Among hospitalised cases with COVID-19 in the US, approximately 90% are over 40 years old, and between 58% to 66% are at least 60 years old.[11] The majority (approximately 60%) of COVID-19 patients admitted to hospitals in the US have been male.[11,12,13,14,15]

African American COVID-19 patients have been reported to have an increased risk of hospitalisation[12,16] and mortality,[17] compared to white patients in the United States. A CDC report examined demographic trends among US COVID-19 deaths from May to August of 2020.[18] During the observation period, the percentage of US COVID-19 deaths that were Hispanic increased from 16.3% in May to 26.4% in August, the only racial or ethnic group among whom the percentage of deaths increased during that time. In terms of setting, 64.3% of deaths occurred in inpatient hospitals and 21.5% in nursing homes or long-term care facilities.

The most recent CDC estimate of the total number of excess deaths (as opposed to overall deaths in the preceding paragraph) across the US from 26 January 2020 to 27 February 2021 from all causes (COVID-19 and otherwise) ranged from 545,600 - 660,200, with an estimated 75-88% of excess deaths being associated with COVID-19.[19] An earlier CDC report on excess deaths covering 26 January 2020 through 3 October 2020 broke down excess deaths by demographics[20]: by age during that period, the largest increase in deaths compared to average expected deaths occurred among adults aged 25-44 (26.5% increase). By race, increases in deaths compared to expectation were largest among Hispanics (53.6% increase), Asian Americans (36.6% increase), African Americans (32.9% increase), and Native Americans and Native Alaskans (28.9% increase), all compared to an excess 11.9% deaths among non-Hispanic whites.

While research earlier in the pandemic tended to focus on adults, more recent data have given greater attention to children and adolescents. For the period January 1- March 31, 2021 across 14 states (the most recently available data), the CDC's COVID-NET database recorded 204 adolescents aged 12-17 who were hospitalized for likely primarily COVID-19-related reasons.[21] The 204 adolescents were 47.5% male—consistent with the COVID case sex distribution across all ages—and disproportionately from minorities, with 31.4% Hispanic and 35.8% non-Hispanic African Americans.[21]

Another recent CDC report described demographic trends in US COVID-19 incidence among 15,068 cases aged 0-24 years across 16 jurisdictions during the period 01 January 2020 through 31 December 2020.[22] The report broke down incidence by age groups and 2020 sub-periods that are presented in Table 4. The table shows that early in 2020, 5-9-year-old were experiencing less COVID-19 than 0-4-year-old, but by the end of the year this pattern had reversed. Compared to 5-9-year-old, the age categories 10-14, 15-19, and 20-24 years old showed progressively greater incidence rates, a pattern that held throughout 2020.

Table 4. COVID-19 incidence and rate ratios, by age group among persons aged <25 years across three periods of 2020 in 16 U.S. jurisdictions [22]

2020 Sub-Period	Age Group (years)	Number of Cases	Cases per 100,000 population (95% CI)	Rate Ratio (95% CI)
Jan 1 - Apr 30	0-4	956	21 (20-23)	1.28 (1.17-1.41)
	5-9	772	17 (16-18)	Reference
	10-14	1,184	25 (23-26)	1.49 (1.36-1.63)
	15-19	3,267	67 (65-70)	4.03 (3.72-4.36)
	20-24	8,889	175 (171-178)	10.47 (9.72-11.26)
May 1 - Aug 31	0-4	14,017	314 (309-319)	1.01 (0.98–1.03)

	15-19	50,210	1,034 (1,025-1,043)	3.32 (3.26–3.38)
	20-24	78,655	1,547 (1,536-1,557)	4.96 (4.88–5.05)
Sep 1 - Dec 31	0-4	33,595	752 (744–760)	0.71 (0.70–0.72)
	5-9	48,824	1,056 (1,047–1,066)	Reference
	10-14	76,922	1,615 (1,604–1,627)	1.53 (1.51–1.55)
	15-19	149,660	3,083 (3,067–3,098)	2.92 (2.89–2.95)
	20-24	187,825	3,693 (3,677–3,710)	3.50 (3.46–3.53)

Other US paediatric data are generally consistent with the CDC findings. Table 5 summarizes demographic results for a retrospective cohort of 135,794 individuals under the age of 25 who were tested for COVID-19 by 08 September 2020 within the PEDSnet network of US paediatric health systems.[23] The table shows that, among the paediatric population, children age 12-17 were more frequently infected than those under age 12. African Americans and Hispanics had elevated frequencies of testing positive relative to their proportion of the cohort.

A study of 1,945,831 individuals aged 0-18 recorded in the Premier Healthcare Database between March and October 2020 included 20,714 paediatric cases of COVID-19; the authors reported similar patterns to what is shown in Table 4, with the additional observation that COVID-19 cases aged 0-1 and 12-18 years were more likely to develop serious illness than those aged 2-11.[24]

Table 5. Demographics of 135,794 US individuals under age 25 tested for COVID-19 by 08 September 2020[23]

Characteristic	Patients, n (%)		
	COVID-19 negative (n=130,420)	**COVID-19 positive, Asymptomatic or mild illness (n=5,015)**	**COVID-19 positive, Severe illness (n=359)**

Risk Factors

While anyone can become infected with SARS-CoV-2, COVID-19 disease can range from very mild (or no symptoms) to severe or fatal. A person's risk of initial infection increases through spending time in close physical proximity to others, especially in indoor spaces with poor ventilation.[25] People living in long-term care facilities or high-density apartment homes, or working in occupations with close proximity to others (e.g. healthcare, transportation), have a higher risk of infection.[25,26] Among children, the primary source of infection is an infected adult living in the same household.[27] According to the CDC, some ethnic minority groups have a higher risk of infection, but age is not associated with risk of initial infection among people aged 5 and older (Table 6).[28,29]

Table 6. Risk for COVID-19 Infection, Hospitalisation, and Death by Age Group and by Race/Ethnicity[29]

		Rate ratios[c]	
Age Group (years)	**Cases[d]**	**Hospitalisation[e]**	**Death[f]**
0-4	<1	<1	<1
5-17[a]	1	<1	<1
18-29	1	1	1
30-39	1	2	4
40-49	1	2	10
50-64	1	4	35
65-74	1	6	95
75-84	1	9	230
85+	1	15	600
Race/Ethnicity			
Non-Hispanic White[b]	1	1	1
American Indian or Alaska Native, non-Hispanic	1.7	3.4	2.4
Asian, non-Hispanic	0.7	1.0	1.0
Black or African American, non-Hispanic	1.1	2.8	2.0
Hispanic or Latino	1.9	2.8	2.3

a. Rate ratios for each age group are relative to the 18-29-year age category. This group was selected as the reference group because it has accounted for the largest cumulative number of COVID-19 cases compared to other age groups.
b. Rate ratios for each race/ethnicity group are relative to the Non-Hispanic White category.
c. Rates are expressed as whole numbers, with values less than 10 rounded to the nearest integer, two-digit numbers rounded to nearest multiple of five, and numbers greater than 100 rounded to two significant digits.
d. Includes all cases reported by state and territorial jurisdictions (accessed on July 12, 2021). The denominators used to calculate rates were based on the 2019 Vintage population (https://www.census.gov/newsroom/press-releases/2019/popest-nation.html).
e. Includes all hospitalizations reported through COVID-NET (from March 1, 2020 through July 3, 2021, accessed on July 12, 2021). Rates were standardized to the 2020 US standard COVID-NET catchment population (https://www.cdc.gov/coronavirus/2019-ncov/covid-data/covid-net/purpose-methods.html).
f. Includes all deaths in National Center for Health Statistics (NCHS) provisional death counts (accessed on July 12, 2021). The denominators used to calculate rates were based on the 2019 Vintage population (https://data.cdc.gov/NCHS/Provisional-COVID-19-Deaths-by-Sex-and-Age/9bhg-hcku).

Risk for severe or fatal COVID-19 disease has been shown to increase with older age, male sex, or ethnic minority status.[30 29 29 31 32 33] Children aged 5-17 typically experience a milder disease course and have lower risk of hospitalization or death.[28 34 35] Among adults, these risks increase for every 10-year age group above age 39 (Table 3).[28 36] Table 6 also gives estimated rate ratios for COVID-19 hospitalisation and death by race/ethnicity relative to white, non-Hispanic persons in the US. The highest risks of hospitalisation and death were observed among American Indian or Alaska native persons (RR = 3.4 for hospitalisation and 2.4 for death) and Hispanic or Latino persons (RR = 2.8 for hospitalisation and 2.3 for death). These differences in risk among ethnic groups may be attributed to differences in underlying factors that are correlated with race/ethnicity including socioeconomic status, access to health care, and occupation-related virus exposure.[29]

Risk of severe or fatal COVID-19 disease is higher among persons who are current or former smokers, have lower socioeconomic status, have no or public insurance, or live in neighbourhoods with higher rates of limited English proficiency. [31] [32] [36] The CDC has also recognised other socio-demographic groups who may need to take extra precautions against COVID-19 due to increased risk for severe illness: pregnant women; breastfeeding mothers; people with disabilities; people with developmental, behavioural or substance abuse disorders; and newly resettled refugee populations.[37]

Among adults, risk for severe or fatal COVID-19 disease increases with the presence of chronic medical conditions, including obesity, chronic lung diseases (e.g., COPD or asthma), cardiovascular disease, diabetes, cancer, liver disease, neurological diseases (e.g., stroke or dementia), chronic kidney disease, sickle cell disease, immunosuppression, HIV higher scores on the WHO Clinical Progression Scale and Charlson Comorbidity Index. [31] [32] [36] [38] Table 7 shows the estimated hazard ratios of COVID-19 mortality associated with these chronic conditions and socio-demographics from a cohort study of 17 million adults (with 17,000 COVID-19-related deaths) in England. [36]

The presence of one or more underlying medical conditions also increases risk of severe or fatal disease among children aged 5-17. [39] [40] [41] [42] In particular, childhood obesity has been consistently associated with two to three times the risk of severe disease or hospitalization. [39] [42] [43] [44] For many other individual comorbid conditions, paediatric sample sizes are very small and different studies produce conflicting results, so it is difficult to estimate precise risk ratios based on current literature. [27] [41]

Table 7. Hazard Ratios and 95% Confidence Intervals for COVID-19-related Death [36]

Characteristic	Category	COVID-19 death Hazard Ratio	
		Adjusted for age, sex, and NHS administrative region	Fully adjusted
Age	18-39	0.05 (0.04-0.06)	0.06 (0.04-0.07)

	Diagnosed 1-4.9 years ago	1.13 (1.04-1.22)	1.11 (1.03-1.20)

Table 7. Hazard Ratios and 95% Confidence Intervals for COVID-19-related Death [36]

Characteristic	Category	COVID-19 death Hazard Ratio	
		Adjusted for age, sex, and NHS administrative region	Fully adjusted
	Diagnosed ≥ 5 years ago	0.99 (0.95-1.04)	2.41 (1.86-3.13)
Hematological malignancy (vs. none)	Diagnosed <1 year ago	2.54 (1.96-3.29)	2.80 (2.08–3.78)
	Diagnosed 1-4.9 years ago	2.28 (1.95-2.66)	2.25 (1.92-2.62)
	Diagnosed ≥ 5 years ago	1.71 (1.51-1.93)	1.65 (1.46-1.87)
Reduced kidney function[c] (vs. none)	eGFR 30-60	1.50 (1.45-1.55)	1.30 (1.25-1.35)
	eGFR 15-< 30	2.74 (2.56-2.93)	2.52 (2.33–2.72)
	eGFR <15 or dialysis	6.40 (5.75-7.12)	4.42 (3.93-4.98)
Liver disease		2.27 (2.01-2.57)	1.75 (1.54-1.98)
Dementia		4.59 (4.33-4.87)	3.62 (3.41-3.84)
Stroke		2.03 (1.95-2.12)	1.53 (1.46-1.59)
Other neurological disease		3.15 (2.96-3.36)	2.72 (2.55-2.90)
Organ transplant		5.54 (4.51-6.81)	1.61 (1.28-2.02)
Asplenia		1.50 (1.16-1.95)	1.26 (0.97-1.64)
Rheumatoid arthritis, lupus, or psoriasis		1.30 (1.21–1.38)	1.23 (1.17-1.30)
Other immunosuppressive condition		2.75 (2.10–3.62)	2.00 (1.57-2.54)

a. Classification by HbA1c is based on the most recent measurement within 15 months of baseline.
b. eGFR is measured in ml min−1 per 1.73 m2 and derived from the most recent serum creatinine measurement.
c. Index of Multiple Deprivation (derived from the patient's postcode)
Models were adjusted for age using a four-knot cubic spline for age, except for estimation of age-group hazard ratios. Ref, reference group; 95% CI, 95% confidence interval.

The main existing treatment options:

Through 28 February 2021, other COVID-19 vaccines were authorized in the EU including vaccines from Moderna (EU/1/20/1507), AstraZeneca (EU/1/21/1529) and Janssen (EU/1/20/1525). Others may subsequently be approved.

Natural history of the indicated condition in the untreated population, including mortality and morbidity:

Symptoms of COVID-19

The clinical manifestations of COVID-19 vary widely, from asymptomatic infection in 17- 45 %, across age groups[45 46 47 48] to critical illness and death. The rate of asymptomatic infection decreases with increasing age and long-term care facilities are associated with a lower rate of asymptomatic infection when compared to household transmission or other healthcare facilities. [48] A recent meta-analysis has estimated that 46.7% of infections in children are asymptomatic. [48] The most common symptoms of COVID-19 are fever, cough, and shortness of breath for both children and adults (Table 8).[49 50]

Table 8. Signs and Symptoms among 291 Paediatric (age <18 years) and 10,944 Adult (age 18–64 years) Patients[a] with laboratory confirmed COVID-19 — United States, February 12–April 2, 2020

Sign/Symptom	No. (%) with sign/symptom	
	Paediatric	Adult
Fever, cough, or shortness of breath[b]	213 (73)	10,167 (93)
Fever[c]	163 (56)	7,794 (71)
Cough	158 (54)	8,775 (80)
Shortness of breath	39 (13)	4,674 (43)
Myalgia	66 (23)	6,713 (61)
Runny nose[d]	21 (7.2)	757 (6.9)
Sore throat	71 (24)	3,795 (35)
Headache	81 (28)	6,335 (58)
Nausea/Vomiting	31 (11)	1,746 (16)
Abdominal pain[d]	17 (5.8)	1,329 (12)
Diarrhea	37 (13)	3,353 (31)

a. Cases were included in the denominator if they had a known symptom status for fever, cough, shortness of breath, nausea/vomiting, and diarrhea. Total number of patients by age group: <18 years (N = 2,572), 18–64 years (N = 113,985).
b. Includes all cases with one or more of these symptoms.
c. Patients were included if they had information for either measured or subjective fever variables and were considered to have a fever if "yes" was indicated for either variable.
d. Runny nose and abdominal pain were less frequently completed than other symptoms; therefore, percentages with these symptoms are likely underestimates.

Progression and Timeline of Mild to Moderate Disease

Mild to moderate disease is defined as the absence of viral pneumonia and hypoxia. For those who develop symptoms, the incubation period is usually 4 to 5 days, with 97.5% experiencing symptoms within 11 days of exposure.[51] [52] Those with mild COVID-19 recover at home with supportive care and guidance to self-isolate. Those with moderate disease are monitored at home and are sometimes recommended to be hospitalised if conditions worsen.[52] Data on rates of re-infection are limited but variants that are not neutralized by immune antisera, such as the recent beta (South African) variant, may lead to increased risk of re-infection in the future. [51]

Progression and Timeline of Severe Disease Requiring Hospitalisation

Those with severe disease will require hospitalisation to manage their illness. Based on data that have been systematically collected for the US by the CDC between 01 August 2020 and 05 September 2021, there were 2,816,280 new hospital admissions for patients with confirmed COVID-19 in the US.[53] For the week ending 22 August 2021, 3.5 patients per 100,000 population were hospitalised due to COVID-19 in 21 countries of the EU/EEA with available data.[54] Based on data from 23 states and New York City, as of August 19, 2021, 1.6%-3.6% of children with COVID-19 have been hospitalised and 0.0-0.03% of children with COVID-19 have died.[55]

The most common symptoms in patients are fever (42-80%), shortness of breath (35-71%), fatigue (33-62%), cough (77-84%), chills (63%), myalgias (63%), headache (59%), and

diarrhea (33%).[56 57 58 59] COVID-19 patients also commonly experience gustatory disorders (44%) and olfactory disorders (53%).[60] Among non-hospitalised children < 18 years of age, 89% experienced one or more typical symptoms of COVID, including fever, cough, shortness of breath, and 22% experienced all three. [57] Approximately 17% to 40% of those hospitalised with COVID-19 experience severe symptoms necessitating intensive care[11 16 56] with 31% of children hospitalised experiencing severe COVID-19 that necessitates intensive care or invasive ventilation or ends in death. Risk factors for severe COVID-19 in hospitalised children include presence of a comorbid condition, younger age, and male sex.[61] More than 75% of patients hospitalised with COVID-19 require supplemental oxygen.[62]

Studies early in the pandemic demonstrated that time from onset of illness to ARDS was 8-12 days and time from onset of illness to ICU admission was 9.5–12 days.[51] In 17 countries of the EU/EEA with available data, 1.8 patients per 100,000 population were in the ICU due to COVID-19 for the week ending 28 February 2021[63]. A recent meta-analysis found that, of patients <19 years of age, 11% went to the ICU, non-invasive ventilation was administered among 12%, and 4% required mechanical ventilation. [46]

Mortality

As of 17 August 2021, there were 620,493 deaths reported in the US for all age groups among 36,951,181 cases (1.7% of cases).[64] As of 17 August 2021 there were 746,566 deaths reported for all age groups in the EU/EEA among 35,381,520 cases (2.1% of cases).[65] As of 17 August 2021, the UK has seen 131,466 deaths from COVID-19 in all age groups among 6,352,224 cases (2.1% of cases).[66] According to a recent meta-analysis of paediatric studies published through October 2020, the mortality for paediatric patients 0.1-2%.[67 46] In a study from January through June 2020 using the National Child Mortality Database (NCMD) in England, 5.7% of 437 children 0-17 years of age who died were SARS-CoV-2 PCR-positive and those who died of COVID-19 were older and were more likely to be non-White ethnicity.[68]

Mortality data are also presented from Worldometer, an independent organisation that publishes current, reliable COVID-19 statistics online.[3] The mortality of SARS-CoV-2 infection is defined as the cumulative number of deaths among detected cases.

As of 15 August 2021, the overall SARS-CoV-2 mortality for the EU + UK was 878,344 deaths, or 171 per 100,000 people. Reported mortality among EU countries and the UK ranged from 18 to 312 deaths per 100,000 (Table 1). Finland and Cyprus reported the lowest mortality; Hungary, Czech Republic, and Bulgaria reported the highest.[4]

In the US, as of 15 August 2021, the mortality was 637,439 deaths (191 per 100,000 people). Mortality in the US was very similar to that of UK (192 per 100,000).

Overall reported mortality among hospitalised COVID-19 patients varies from 12.8% to 26% in the EU, US and UK. [16,18,69,70] Mortality rates are declining over time, presumably due to an improved understanding of COVID-19 and its management.[71]

Complications of COVID-19 and Long-COVID

Complications of COVID-19 include impaired function of the heart, brain, lung, liver, kidney, and coagulation system.[11,14,72] Based on a meta-analysis of 42 studies, the risk of thromboembolism was 21% overall and 31% in the ICU, with the pooled odds of mortality being 74% higher among those who experienced thromboembolism compared to those who did not.[73]

COVID-19 symptoms can persist weeks or months beyond the acute infection.[74,75] The NICE guideline scope published on 30 October 2020 defined "Long COVID" signs and symptoms that continue or develop after acute COVID-19. It includes both ongoing symptomatic COVID-19 (from 4 to 12 weeks) and post-COVID-19 syndrome (12 weeks or more and for which signs and symptoms are not explained by an alternative diagnosis).[76]

A meta-analysis of 31 studies among patients between 18 to 49 years of age found that COVID-19 symptoms were experienced for 14 days to 3 months post-infection, including persistent fatigue (39–73%), breathlessness (39–74%), decrease in quality of life (44–69%), impaired pulmonary function, abnormal CT findings including pulmonary fibrosis (39–83%), evidence of peri-/perimyo-/myocarditis (3–26%), changes in microstructural and functional brain integrity with persistent neurological symptoms (55%), increased incidence of psychiatric diagnoses (5.8% versus 2.5–3.4% in controls), and incomplete recovery of olfactory and gustatory dysfunction (33–36%).[77] Post-acute COVID symptoms in children with asymptomatic or mild disease appear to be less severe than in adults, with the most common symptoms being a post-viral cough (4%), fatigue (2%), or both symptoms (1%) with the duration of symptoms lasting 3 to 8 weeks[78].

Children who are infected with COVID-19 are at risk of subsequent multisystem inflammatory syndrome (MIS-C) and often develop a rash following resolution of COVID-19.[46 79, 80] As of August 19, 2021 there were 4,403 cases of MIS-C reported to health departments in the United States.[81]. Additional symptoms of MIS-C include abdominal pain, bloodshot eyes, chest tightness or pain, diarrhoea, lethargy, headache, low blood pressure, neck pain, and vomiting.[82]

Important co-morbidities:

Important comorbidities in hospitalised COVID-19 patients include hypertension, diabetes, obesity, cardiovascular disease, chronic pulmonary disease or asthma, chronic kidney disease, cancer, and chronic liver disease. [12,13,14 56 59] Prevalence of these conditions have been reported to be lower in mild cases and higher among fatal cases, as shown for European countries in Table 9 using TESSy data posted on 12 August 2021[83] below.

Table 9. Preconditions among COVID-19 Patients in EU/EEA, by Severity of Disease. Case-based Data from TESSy Reported 12 August 2021[83]

	EU/EEA, reported on 12 August 2021			
	Mild	**Hosp**	**Severe**	**Fatal**
Total N	1,948,252	356,472	52,365	109,878

Abbreviation: Hosp = Hospitalised

Table 10 below summarises comorbidities among US COVID-19 patients in a retrospective cohort study conducted among 629,953 individuals tested for COVID-19 in a large health system in the US Northwest between 01 March and 31 December 2020.[31] The most common comorbidities were similar in the full cohort and among those who tested positive: obesity, hypertension, diabetes, and asthma. Among those hospitalised for COVID-19, a large number of comorbidities had elevated prevalence compared to the full cohort and those who tested positive: obesity, hypertension, diabetes, kidney disease, congestive heart failure, coronary artery disease, and chronic obstructive pulmonary disease.

Table 10. Comorbidities in Individuals tested for COVID-19 in the Providence St. Joseph Health System – States of California, Oregon, and Washington, 01 March–31 December 2020[31]

Comorbidity	Tested (N= 629,953) %	Positive (N= 54,645) %	Hospitalised (N= 8,536) %
Hypertension	23.3	19.8	40.2
Diabetes	9.4	10.9	28.3
Weight			
Underweight	2.1	1.7	3.1
Normal	29.0	23.9	24.3
Overweight	31.7	32.6	30.3
Class 1 Obesity	19.8	22.3	21.2
Class 2 Obesity	9.6	11.1	10.9
Class 3 Obesity	7.7	8.6	10.3
Asthma	6.5	5.3	6.7
Chronic Obstructive Pulmonary Disease	4.0	2.6	8.3
Coronary Artery Disease	5.5	3.6	9.7
Myocardial Infarction	2.2	1.6	5.5
Congestive Heart Failure	5.3	3.9	13.2
Kidney Disease	5.6	5.3	17.2
Liver Disease	3.1	2.5	4.0
Cancer	6.1	3.0	6.3

In a retrospective cohort of 135,794 individuals under the age of 25 who were tested for COVID-19 by 08 September 2020 within the PEDSnet network of US paediatric health systems, the proportion of obese individuals was similar among those who tested negative (18%) and among mild or asymptomatic COVID-19 cases (19%), but clearly elevated among severe COVID-19 cases (37%)[84]. Those with severe cases of COVID-19 more commonly had chronic conditions in at least two body systems, with 25% of COVID-19 negative individuals, 17% mild or asymptomatic cases, and 38% of severe cases having multiple chronic conditions. More recent data provide insight into comorbidities among the paediatric population. For the period January 01- March 31, 2021 across 14 states, the CDC's COVID-NET database recorded 204 adolescents aged 12-17 who were hospitalized for likely primarily COVID-related reasons.[85] Among the 204 adolescents, 70.6% had at least one major underlying medical condition, the most common conditions being obesity (35.8%), chronic lung diseases including asthma (30.9%), and neurologic disorders (14.2%).[85]

Module SII. Non-Clinical Part of the Safety Specification

Nonclinical evaluation of BNT162b2 (COVID-19 mRNA vaccine) included pharmacology (mouse immunogenicity and NHP immunogenicity and challenge studies), pharmacokinetic (series of biodistribution, metabolism and pharmacokinetic studies), and toxicity (2 GLP rat repeat-dose toxicity) studies in vitro and in vivo. A GLP DART study has been completed. No additional toxicity studies are planned for COVID-19 mRNA vaccine.

Nonclinical studies in mice and NHP for COVID-19 mRNA vaccine demonstrated both a strong neutralizing antibody response and a Th1-type $CD4^+$ and an $IFN\gamma^+$ $CD8^+$ T-cell response. The Th1 profile is characterised by a strong IFNγ, but not IL-4, response indicating the absence of a potentially deleterious Th2 immune response and is a pattern favored for vaccine safety and efficacy.[86] Rhesus macaques (Study VR-VRT-10671) that had received two IM immunisations with 100 µg COVID-19 mRNA vaccine or saline 21 days apart were challenged with 1.05×10^6 plaque forming units of SARS-CoV-2 (strain USA-WA1/2020), split equally between the intranasal and intratracheal routes.[87] COVID-19 mRNA vaccine provided complete protection from the presence of detectable viral RNA in the lungs compared to the saline control with no clinical, radiological or histopathological evidence of vaccine-elicited disease enhancement.

An intravenous rat PK study, using an LNP with the identical lipid composition as COVID-19 mRNA vaccine, demonstrated that the novel lipid excipients in the LNP formulation, ALC-0315 and ALC-0159, distribute from the plasma to the liver. While there was no detectable excretion of either lipid in the urine, the percent of dose excreted unchanged in feces was ~1% for ALC-0315 and ~50% for ALC-0159. Further studies indicated metabolism played a role in the elimination of ALC-0315. Biodistribution was assessed using luciferase expression as a surrogate reporter formulated like COVID-19 mRNA vaccine, with the identical lipid composition. After IM injection of the LNP-formulated RNA encoding luciferase in BALB/c mice, luciferase protein expression was demonstrated at the site of injection 6 hours post dose and expression decreased over time to almost reach background levels after 9 days. Luciferase was detected to a lesser extent in the liver; expression was present at 6 hours after injection and was not detected by 48 hours after injection. After IM administration of a radiolabelled LNP-mRNA formulation containing ALC-0315 and ALC-0159 to rats, the percent of administered dose was also greatest at the injection site. Outside of the injection site, total recovery of radioactivity was greatest in the liver and much lower in the spleen, with very little recovery in the adrenal glands and ovaries. The metabolism of ALC-0315 and ALC-0159 was evaluated in blood, liver microsomes, S9 fractions, and hepatocytes from mice, rats, monkeys, and humans. The in vivo metabolism was examined in rat plasma, urine, feces, and liver samples from the PK study. ALC-0315 and ALC-0159 are metabolised by hydrolytic metabolism of the ester and amide functionalities, respectively, and this hydrolytic metabolism is observed across the species evaluated.

In GLP toxicity studies, two variants of the COVID-19 mRNA vaccine candidate were tested, designated “variant 8” and “variant 9” (V8 and V9, respectively). The variants differ only in their codon optimisation sequences which are designed to improve antigen expression, otherwise the amino acid sequences of the encoded antigens are identical.

COVID-19 mRNA vaccine (V9) was evaluated clinically and submitted for application. Two GLP-compliant repeat-dose toxicity studies were performed in Wistar Han rats; one with each variant. Both studies were 17 days in duration with a 3-week recovery period. A DART study in Wistar Han rats has been completed. Safety pharmacology, genotoxicity and carcinogenicity studies have not been conducted, in accordance with the 2005 WHO vaccine guideline.[88]

The IM route of exposure was selected for nonclinical investigation as it is the clinical route of administration. Rats were selected as the toxicology test species as they demonstrated an antigen-specific immune response to the vaccine and are routinely used for regulatory toxicity studies with an extensive historical safety database.

Administration of up to 100 µg COVID-19 mRNA vaccine by IM injection to male and female Wistar Han rats once every week, for a total of 3 doses, was tolerated without evidence of systemic toxicity. Expected inflammatory responses to the vaccine were evident such as oedema and erythema at the injection sites, transient elevation in body temperature, elevations in WBC count and acute phase reactants, and lower A:G ratios. Injection site reactions were common in all vaccine-administered animals and were greater after boost immunisations. Changes secondary to inflammation included slight and transient reduction in body weights and transient reduction in reticulocytes, platelets and RBC mass parameters. Decreased reticulocytes were reported in rats treated with the licensed LNP-siRNA pharmaceutical Onpattro™ (NDA # 210922) but have not been observed in humans treated with this biotherapeutic[89] suggesting this is a species-specific effect. Decreased platelet counts were noted after repeat administration, but were small in magnitude of change, likely related to inflammation-related platelet activation and consumption, and unassociated with other alterations in haemostasis. Elevated levels of gamma-glutamyl transferase were observed in the first repeat-dose toxicity study with COVID-19 mRNA vaccine (V8) without evidence of cholestasis or hepatobiliary injury but was not recapitulated in the second repeat dose-toxicity study with COVID-19 mRNA vaccine (V9), the final clinical candidate. All changes in clinical pathology parameters and acute phase proteins were reversed at the end of the recovery phase for COVID-19 mRNA vaccine, with the exception of low magnitude higher red cell distribution width (consistent with a regenerative erythroid response) and lower A:G ratios (resulting from acute phase response) in animals administered COVID-19 mRNA vaccine. Macroscopic pathology and organ weight changes were also consistent with immune activation and inflammatory response and included increased size and/or weight of draining iliac lymph nodes and spleen. Vaccine-related microscopic findings at the end of the dosing phase consisted of oedema and inflammation in injection sites and surrounding tissues, increased cellularity in the draining iliac lymph nodes, bone marrow and spleen and hepatocyte vacuolation in the liver. Vacuolation of portal hepatocytes, the only test article-related liver microscopic finding, was not associated with any microscopic evidence of hepatic injury or hepatic functional effects (i.e., liver functional enzymes were not elevated) and may be associated with hepatocyte uptake of the LNP lipids.[90] Microscopic findings at the end of the dosing phase were partially or completely recovered in all animals at the end of the 3-week recovery period for COVID-19 mRNA vaccine. A robust immune response was elicited to the COVID-19 mRNA vaccine antigen.

Administration of COVID-19 mRNA vaccine to female rats twice before the start of mating and twice during gestation at the human clinical dose (30 µg) was associated with non-adverse effects (body weight, food consumption and effects localized to the injection site) after each dose administration. However, there were no effects of COVID-19 mRNA vaccine administration on mating performance, fertility, or any ovarian or uterine parameters in the F0 female rats nor on embryo-fetal or postnatal survival, growth, or development in the F1 offspring. An immune response was confirmed in F0 female rats following administration of each vaccine candidate and these responses were also detectable in the F1 offspring (fetuses and pups).

In summary, the nonclinical safety findings related to COVID-19 mRNA vaccine administration primarily represent an expected immune reaction to vaccine administration and are clinically manageable or acceptable risks in the intended population. The key safety findings regarding COVID-19 mRNA vaccine from nonclinical studies and their relevance to human usage are presented in Table 11. There was no evidence of vaccine-elicited disease enhancement.

Table 11. Key Safety Findings and Relevance to Human Usage

Key Safety findings from Nonclinical Studies [a]	Relevance to Human Usage
Pharmacology	
NHP Challenge Model • No evidence of vaccine-elicited disease enhancement.	• Suggests low risk of vaccine-enhanced disease in humans; being investigated in CTs.
Toxicity	
Injection site reactions: • Injection site reactions were common and reversible or showed signs of reversibility at the end of the 3-week recovery period in nonclinical studies.	• In common with other vaccines, COVID-19 mRNA vaccine administration has the potential to generate injection site reactions such as oedema and erythema at the injection sites.
Inflammation and immune activation: • Evidence of inflammation or immune activation was common, reversible, and included transiently higher body temperature, higher circulating WBCs, and higher acute phase reactants. Secondarily, transiently lower body weights, reticulocytes, platelets, and RBC mass parameters were observed.	• In common with all vaccines, COVID-19 mRNA vaccine administration has the potential to generate inflammation which can lead to increased body temperature, higher circulating WBCs and higher acute phase proteins. • Decreased reticulocytes have not been observed in humans treated with the LNP-siRNA pharmaceutical Onpattro[89], suggesting this finding in rats is a species-specific effect. • COVID-19 mRNA vaccine administration has the potential to transiently decrease platelets and RBC mass parameters. These slight decreases are not likely to be clinically meaningful due to their small magnitude.
Developmental and Reproductive Toxicity • No vaccine-related effects on female fertility or the development of fetuses or offspring were observed in a DART study of COVID-19 mRNA vaccine in rats.	• No effects are anticipated in WOCBP, pregnant women or their offspring.

a. Safety pharmacology, genotoxicity, and carcinogenicity studies were not conducted, in accordance with 2005 WHO vaccine guideline, as they are generally not considered necessary to support development and licensure of vaccines for infectious diseases.[88] In addition, the components of the vaccine construct are lipids and RNA and are not expected to have carcinogenic or genotoxic potential.

Module SIII. Clinical Trial Exposure

BioNTech is conducting a first-in-human dose level–finding Phase 1/2 study (BNT162-01) in Germany to gather safety and immunogenicity data to enable evaluation of 4 vaccine candidates individually to inform the overall clinical development of a COVID-19 mRNA vaccine.

BNT162-01 is not conducted under the US IND application but is being conducted under a German Clinical Trial Application.

Four vaccine candidates were evaluated in Study BNT162-01. Based on safety and immunogenicity results from this study, 2 vaccine candidates, BNT162b1 and BNT162b2, were selected for evaluation in Study C4591001, which is a Phase 1/2/3 randomised, placebo-controlled, observer-blind, dose-finding, vaccine candidate-selection, and efficacy study in healthy adults.

Phase 1 of Study C4591001 comprised dose-level–finding evaluations of the 2 selected vaccine candidates; multiple dose levels (some corresponding to those evaluated in Study BNT162-01) were evaluated. Study vaccine was administered using the same 2-dose schedule as in Study BNT162-01 (21 days apart). Dose levels were administered first to an 18- to 55-year age cohort, then to a 56- to 85-year age cohort.

Both vaccine candidate constructs were safe and well tolerated. BNT162b2 at the 30-µg dose level was selected and advanced to the Phase 2/3 expanded cohort and efficacy evaluation primarily because:

- the reactogenicity profile for BNT162b2 was more favourable than BNT162b1 in both younger and older adults with similar immunogenicity results;
- in the NHP challenge study (VR-VTR-10671 – see Module SII), a trend toward earlier clearance of BNT162b2 was observed in the nose.

Phase 2 of the study (for which enrolment has completed) comprised the evaluation of safety and immunogenicity data for the first 360 participants (180 from the active vaccine group and 180 from the placebo group, with each group divided between the younger and older age cohorts) entering the study after completion of Phase 1.

The Phase 3 part of the study (which is ongoing) evaluates the efficacy and safety in all participants (including the first 360 participants from Phase 2). Phase 3 introduced enrolment of participants 16 to 17 years of age to be evaluated with the 18- to 55-year-old cohort, as well as enrolment of a 12- to 15-year-old cohort, and immunogenicity data from participants 12- to 15 year-old cohort (Table 12, Table 14, Table 20, Table 22, Table 24, and Table 26) are anticipated to bridge to the 16- to 25-year-old cohort.

The pivotal study was initially planned to enrol approximately 30,000 participants, which would have a probability of 78% of detecting an AE with a frequency of 0.01% (1/1000) and a probability of 95% of detecting an AE with a frequency of 0.02% (1/500). The protocol

was amended to enrol approximately 46,000 participants, which slightly enhanced the ability to detect AEs. However, rarer events might not be detected.

Participants in the pivotal study were initially planned to be followed for up to 24 months in order to assess the potential for late-occurring adverse reactions, such as the theoretical risk of VAED including VAERD. After completing the final efficacy analysis with vaccine efficacy shown to be 95%, and obtaining regulatory authorisation to vaccinate in many countries, MAH started to unblind all participants to determine those participants randomised to placebo so that they could be offered vaccine in accordance with local authorisation. To date, most placebo subjects have been unblinded to receive active vaccine at or prior to 6 months after the second dose, therefore, a placebo group for comparison of safety data are only available for up to 6 months post Dose 2.

The initial efficacy analysis on the 16 years and older population was event-driven, with prespecified interim analyses after accrual of at least 62, 92, and 120 cases and a final analysis at 164 cases.

Analysis of 6-month post Dose-2 data was conducted on 16 years of age and older cohort reported at 13 March 2021.

A further efficacy analysis has been conducted on 12- to 15-year-old cohort participants reported by 13 March 2021.

Further evaluation for the paediatric population (5-<12 years of age) has been conducted in study C4591007.

Phase 1 is the dose finding portion of the study. Dose levels were tested in sentinel cohorts of children by age de-escalation, starting with the lowest dose level in the oldest age group. For each age group, the dose level identified as safe and tolerable and immunogenic in C4591007. Phase 1 was advanced for further evaluation in Phase 2/3.

Phase 2/3 (which is ongoing) was planned to evaluate BNT162b2 at the selected dose levels for each age group for safety and tolerability, immunogenicity, and efficacy (depending on meeting success criteria for immunobridging and accrual of a sufficient number of COVID-19 cases). An immunobridging analysis was designed to compare SARS-CoV-2 neutralizing antibody responses in paediatric participants within each age group in Study C4591007 to a group of young adult participants 16 to 25 years of age in the C4591001 efficacy study.

Ongoing[2] Pfizer-BioNTech COVID-19 mRNA vaccine studies also include:

- C4591005: *A phase 1/2 study placebo-controlled, randomized, and observer-blind study to evaluate the safety, tolerability, and immunogenicity of a SARS-CoV-2 RNA vaccine candidate against COVID-19 in healthy Japanese adults.*

[2] Study C4591017 was completed and therefore is removed from this list

One hundred sixty participants were randomly assigned in a 3:1 ratio to study intervention (candidate vaccine: 120, placebo: 40).

- C4591015: *A phase 2/3 placebo-controlled, randomized, observer-blind study to evaluate the safety, tolerability, and immunogenicity of SARS-CoV-2 RNA vaccine candidate (BNT162b2) against COVID-19 in healthy pregnant women 18 years of age and older.*.

- C4591020 *A phase 3, randomized, observer-blind study to evaluate the safety, tolerability, and immunogenicity of multiple formulations of the vaccine candidate BNT-162B2 against Covid-19 in healthy adults 18 through 55 years of age*.

- C4591031 *A phase 3 master protocol to evaluate additional dose(s) of BNT162B2 in healthy individuals previously vaccinated with BNT162B2*.

- BNT162 01 *A multi-site, phase I/II, 2-Part, dose-escalation trial investigating the safety and immunogenicity of four prophylactic SARS-CoV-2 RNA vaccines against COVID 19 using different dosing regimens in healthy and immunocompromised adults.*

- BNT162 03[3] *Safety and immunogenicity of SARS-CoV-2 mRNA vaccine (BNT162b1) in Chinese healthy subjects: A phase I, randomized, placebo- controlled, observer-blind study*.

- BNT162-04 *A multi-site, phase I/II, 2-part, dose escalation trial investigating the safety and immunogenicity of a prophylactic SARS-CoV-2 RNA vaccine (BNT162b3) against COVID-19 using different dosing regimens in healthy adults*.

- BNT162-06[3] *Safety and immunogenicity of SARS-CoV-2 mRNA vaccine (BNT162b2) in Chinese healthy population: A phase II, randomized, placebo-controlled, observer-blind study*

- BNT162-14 *A Phase II, open-label, rollover trial to evaluate the safety and immunogenicity of one or two boosting doses of Comirnaty or one dose of BNT162b2s01 in BNT162-01 trial subjects, or two boosting doses of Comirnaty in BNT162-04 trial subjects*

- BNT162-17 *A Phase II trial to evaluate the safety and immunogenicity of a SARS-CoV-2 multivalent RNA vaccine in healthy subjects.*

- B7471026 *A phase 3, randomized, double blind trial to describe the safety and immunogenicity of 20 valent pneumococcal conjugate vaccine when coadministered with a booster dose of BNT162b2 in adults 65 years of age and older*

[3] This study is conducted by Shanghai Fosun Pharmaceutical Development, Inc. and sponsored by BioNTech SE.

Population for analysis of CT data in this RMP includes the following 3 trials:

- C4591007; Phase 1/2/3, Phase 1 - open label dose-finding study to evaluate safety, tolerability, and immunogenicity and phase 2/3- placebo-controlled, observer- blinded safety, tolerability, and immunogenicity study of a SARS-CoV-2 RNA vaccine candidate against COVID-19 in healthy children and young adults.

- C4591001: Phase 1/2/3, placebo-controlled, randomised, observer-blind, dose-finding, study to evaluate the safety, tolerability, immunogenicity, and efficacy of SARS-CoV-2 RNA vaccine candidates against COVID-19 in healthy individuals.

- BNT162-01: A multi-site, phase I/II, 2-part, dose-escalation trial investigating the safety and immunogenicity of four prophylactic SARS-CoV-2 RNA vaccines against COVID-19 using different dosing regimens in healthy adults.

Participants 16 years of age and older

At the cut-off date of 13 March 2021, a total of 44,245 participants were vaccinated in the COVID-19 mRNA vaccine clinical development program:

- 21,745 participants received 2 doses and 360 received 1 dose of COVID-19 mRNA vaccine during blinded follow-up period; 96 participants from study BNT162-01 received 2 doses of the vaccine.

- 22,044 participants received placebo (of these 19,647 then received 1 dose of COVID-19 mRNA vaccine in the open-label follow-up period after unblinding); none from study BNT162-01.

Exposure to COVID-19 mRNA vaccine for participants aged 16 years and older in the 2 ongoing studies by number of doses, and demographic characteristics is shown in Table 12 through Table 31.

In addition, exposure in clinical studies in special populations is provided in Table 32, Table 33, Table 34, Table 35 and in Table 44.

Participants aged 12- to 15 years of age

Clinical study exposure data for the 12- to 15 years of age are provided for the ongoing study C4591001 at the cut-off date of 13 March 2021.

In this study, a total of 2260 participants 12- to 15 years of age were vaccinated in the COVID-19 mRNA vaccine clinical development:

- 1124 participants received 2 doses and 7 received 1 dose of COVID-19 mRNA vaccine in the Blinded-Placebo Controlled Follow-up period.

- 1129 participants received placebo (of these 49, then received 1 dose of COVID-19 mRNA vaccine in the Open-Label Follow-up period after unblinding).

Exposure to COVID-19 mRNA vaccine for participants aged 12- to 15 years of age by number of doses and demographic characteristics, at the cut-off date of 13 March 2021, is shown in Table 12, Table 14, Table 20, Table 24, and Table 26.

Participants aged 5 to <12 years of age

As of the cut-off date of 06 September 2021, a total of 48 participants in Phase 1 and of 1518 participants in Phase 2/3 were vaccinated in the Pfizer BioNTech COVID-19 Vaccine clinical development program:

Clinical study exposure data for the 5 to <12 years of age are provided for the ongoing study C4591007 at the cut-off date of 06 September 2021. In this study, 1515 participants received 2 doses and 3 received 1 dose of Pfizer BioNTech COVID-19 Vaccine in the Blinded-Placebo Controlled Follow-up period.

Exposure to Pfizer-BioNTech COVID-19 Vaccine for participants aged 5- to <12 years of age by number of doses and demographic characteristics for Phase 1 are shown in Table 36, Table 37, Table 38 and Table 39; for Phase 2/3 are shown in Table 40, Table 41, Table 42 and Table 43.

Exposure in participants 12 years of age and older (Study C4591001)

Table 12. Exposure to BNT162b2 by Age Group and Dose (C4591001) – Blinded Placebo-Controlled Follow-up Period

Module SIV. Populations Not Studied in Clinical Trials

SIV.1. Exclusion Criteria in Pivotal Clinical Studies Within the Development Programme

Detailed descriptions of all inclusion and exclusion criteria for clinical studies are provided in the individual CSRs.

Inclusion criteria

- Healthy participants who are determined by medical history, physical examination (if required), and clinical judgment of the investigator to be eligible for inclusion in the study.

- Healthy participants with pre-existing stable disease, defined as disease not requiring significant change in therapy or hospitalisation for worsening disease during the 6 weeks before enrolment, can be included. In order for the overall Phase 3 study population to be as representative and diverse as possible, the inclusion of participants with known chronic stable infection with HIV, HCV, or HBV was permitted as the study progressed. Specific criteria for these Phase 3 participants can be found in the Section 10.8 of C4591001 protocol.

- Phase 2/3 only: Participants who, in the judgment of the investigator, are at higher risk for acquiring COVID-19 (including, but not limited to, use of mass transportation, relevant demographics, front-line essential workers and others).

- The participants enrolled were 12 years of age and older; with the 12- to 15-year-old cohort included in the protocol starting from October 2020.

Exclusion criteria

Phase 1 exclusion criteria were stricter than criteria in Phases 2 and 3 of the study. Participants were excluded from the studies according to the general criteria listed below:

- **Previous vaccination with any coronavirus vaccine**

  Reason for exclusion: To avoid confounding the assessment of serological or clinical immune response in the study population.

  Is it considered to be included as missing information? No.

  Rationale: Minimal potential clinical impact on the target population.

- **Previous clinical or microbiological diagnosis of COVID-19**

  Reason for exclusion: Phase 1 excluded participants with a previous clinical or microbiological diagnosis of COVID-19 because these participants may have some degree of protection from subsequent infection by SARS-CoV-2 and therefore would confound the pivotal efficacy endpoint.

During Phase 2/3, participants with prior undiagnosed infection were allowed to be enrolled. Screening for SARS-CoV-2 with nucleic acid amplification test by nasal swab or antibodies to non-vaccine SARS-CoV-2 antigen by serology was not conducted before vaccine administration in Phase 2/3, but samples were taken to run these assays after vaccination, thus identifying participants with unidentified prior infection. This group will be assessed to identify whether prior infection affects safety.

Is it considered to be included as missing information? No.

Rationale: Safety in study participants with prior infection will be assessed in the pivotal study.

- **Immunocompromised individuals with known or suspected immunodeficiency, as determined by history and/or laboratory/physical examination**

  Reason for exclusion: Immunocompromised participants may have impaired immune responses to vaccines and would therefore limit the ability to demonstrate efficacy, which is the primary pivotal endpoint.

  Is it considered to be included as missing information? Yes.

  Rationale: Participants with potential immunodeficient status were not specifically included in the study population. However, since the study population is intended to be as representative as possible of the vulnerable population to COVID-19 illness, sub-analyses of immunogenicity data in future studies may provide further understanding of immune responses in this population.

- **Receipt of blood/plasma products or immunoglobulin, from 60 days before study intervention administration or planned receipt throughout the study**

  Reason for exclusion: To avoid confounding the assessment of serological or clinical immune response in the study population.

  Is it considered to be included as missing information? No.

  Rationale: No impact on the safety of the target population.

- **Women who are pregnant or breastfeeding**

  Reason for exclusion: To avoid use in a vulnerable population.

  Is it considered to be included as missing information? Yes.

  Rationale: Maternal vaccination with COVID 19 mRNA vaccine is being studied in C4591015 to explore unexpected negative consequences to the embryo or foetus.

- **Other medical or psychiatric condition including recent (within the past year) or active suicidal ideation/behaviour or laboratory abnormality that may increase the risk of study participation or, in the investigator's judgment, make the participant inappropriate for the study**

  Reason for exclusion: To avoid misleading results deriving from non-compliance to study procedures.

  Is it considered to be included as missing information? No.

  Rationale: Safety profile of COVID-19 mRNA vaccine is not expected to differ in these subjects when properly administered.

SIV.2. Limitations to Detect Adverse Reactions in Clinical Trial Development Programmes

The clinical studies are limited in size and, therefore, unlikely to detect very rare adverse reactions, or adverse reactions with a long latency.

SIV.3. Limitations in Respect to Populations Typically Under-Represented in Clinical Trial Development Programmes

There has been limited exposure to COVID-19 mRNA vaccine in some special populations and no epidemiologic studies have been conducted in pregnant/breastfeeding women, paediatric participants (<12 years of age), and specific subpopulations that were excluded from the COVID-19 mRNA vaccine program.

Table 44. Exposure of Special Populations included or not in Clinical Trial Development Programmes

Type of special population	Exposure
Pregnant women	There is limited experience with use of COVID-19 mRNA vaccine in pregnant women. Animal studies do not indicate direct or indirect harmful effects with respect to pregnancy, embryo/foetal development, parturition or post-natal development. Administration of COVID-19 mRNA vaccine in pregnancy should only be considered when the potential benefits outweigh any potential risks for the mother and foetus. **Participants 5 to <12 years of age** Through the cut-off date of 06 September 2021, there were no CT cases of pregnancy from study C4591007. **Participants 12 to 15 years of age** Through the cut-off date of 13 March 2021, there were no cases of pregnancies. **Participants 16 years of age and older** Through the cut-off date of 13 March 2021, there were 50 cases (52 events) originating from Study C4591001, and all were unique pregnancies.

Table 44. Exposure of Special Populations included or not in Clinical Trial Development Programmes

Type of special population	Exposure
Breastfeeding women	Breastfeeding women were not initially included in the COVID-19 mRNA vaccine clinical development program. It is unknown whether COVID-19 mRNA vaccine is excreted in human milk. The developmental and health benefits of breastfeeding should be considered along with the mother's clinical need for COVID-19 mRNA vaccine and any potential adverse effects on the breastfed newborn/infant/toddler from COVID-19 mRNA vaccine or from the underlying maternal condition. For preventive vaccines, the underlying maternal condition is susceptible to disease prevented by the vaccine. **Participants 5 to <12 years of age** Through the cut-off date of 06 September 2021, there were no cases indicative of exposure during breastfeeding from study C4591007. **Participants 12 to 15 years of age** Through the cut-off date of 13 March 2021, there were no CT cases indicative of exposure during breastfeeding. **Participants 16 years of age and older** Through the cut-off date of 13 March 2021, there were no CT cases indicative of exposure during breastfeeding.
Participants with relevant comorbidities: • Participants with hepatic impairment • Participants with renal impairment • Participants with cardiovascular disease • Immunocompromised participants • Participants with a disease severity different from inclusion criteria in CTs	Healthy participants with pre-existing stable disease, defined as disease not requiring significant change in therapy or hospitalisation for worsening disease during the 6 weeks before enrolment, were included. This allowed enrolment of a proportion of participants with common comorbidities such as cardiovascular diseases including hypertension, chronic pulmonary diseases, asthma, chronic liver disease, BMI >30 kg/m^2, participants with stage 3 or worse chronic kidney disease, and participants with varying disease severity. Participants with potential immunodeficient status were not specifically included in the study population. **Participants 5 to < 12 years of age** Please refer to Table 39 and Table 43 for the exposure of special populations. **Participants 12 to 15 years of age** Please refer to Table 32 and Table 33 for the exposure of special populations. **Participants 16 years of age and older** Please refer to Table 34 and Table 35 for the exposure of special populations.
Population with relevant different ethnic origin/race	Please refer to Table 24 to Table 31 for exposure information by ethnic origin/race from the studies.
Subpopulations carrying relevant genetic polymorphisms	No data available.

Table 44. Exposure of Special Populations included or not in Clinical Trial Development Programmes

Type of special population	Exposure
Paediatric participants	The safety and efficacy of COVID-19 mRNA vaccine in children and adolescents aged less than 2 years of age have not yet been established. Limited data are available. **Participants 5 to < 12 years of age** A total of 48 participants in Phase 1, 5 to < 12 years of age and of 1518 participants in Phase 2/3 received Pfizer BioNTech COVID-19 Vaccine through the cut-off date of 06 September 2021. **Participants 12 to 15 years of age** One thousand a hundred eighty (1180) paediatric participants 12 to 15 years of age received COVID-19 mRNA vaccine through the cut-off date of 13 March 2021 (Table 12 and Table 14). **Participants 16 years of age and older** Six hundred and seventy-one (671) paediatric participants 16 to 17 years of age received COVID-19 mRNA vaccine through the DLP of 13 March 2021 (Table 12 and Table 14).
Elderly (≥65 years old)	Clinical studies of COVID-19 mRNA vaccine included a total of 8846 participants 65 years of age and over; of these, 8827 were from study C4591001, through the cut-off date of 13 March 2021: • 4590 participants in the blinded placebo-controlled follow-up period (Table 12) • 4237 participants in the open-label follow-up period after unblinding (Table 14) Nineteen (19) participants 65 years of age and over were from study BNT162-01 study through the cut-off date of 23 October 2020 (Table 15).

Abbreviations: BMI = body mass index; CT = clinical trial; DLP = data lock point.

Module SV. Post-Authorisation Experience

SV.1. Post-Authorisation Exposure

It is not possible to determine with certainty the number of individuals who received COVID-19 mRNA vaccine since it was first authorised for emergency use on 01 December 2020. Estimated worldwide shipped doses may serve as a reasonable indicator of subject exposure by region and countries; the estimated exposure by gender and age group is not available.

Cumulatively, through 18 June 2021, approximately 774,478.440 doses of COMIRNATY were shipped worldwide, corresponding to 642,817,105 estimated administered doses.

The worldwide number of shipped doses may serve as a reasonable indicator of subject exposure, considering that approximately 83% of the shipped doses were administered. This ratio represents the proportion of doses cumulatively administered (as per public available

data for the EEA[4] countries and the US[5]) out of those cumulatively shipped (based on MAH data according to the shipment tracker [Order Book][6]).

Data about the number of COMIRNATY doses administered is available for EEA, Japan and US. COMIRNATY exposure data by age group is available for some EEA countries and for Japan (elderly and health workers, Table 47). Currently there are no available public data that allow to estimate the COMIRNATY exposure by gender.

Cumulative worldwide estimated exposure[7] by dose, and region based on or extrapolated from internal data (number of shipped doses) and published data (number of doses administered) is displayed in Table 45.

Table 45. Cumulative Estimated Shipped and Administered Doses of COMIRNATY by Region Worldwide, through 18 June 2021

Region/Country/Other	% of Doses	Total Number of Shipped Doses	Total Number of Administered Doses
Europe	41.8	323502270	268506884
European Union[a] (27)	33.3	257628345	213831526
Additional EEA Countries[a] (3)	0.5	3559335	2954248
Other Countries[b]	8.0	62314590	51721110
North America[c]	29.8	230593605	191392692
US	26.6	205645305	170685603
Canada	3.2	24948300	20707089
Central and South America[d]	7.4	57644730	47845126
Asia	19.5	150739485	125113773

Other Countries[e]	7.3	56569695	46952847
Oceania	0.7	5681520	4715662
Australia/New Zealand[a]	0.7	5681520	4715662
Other Countries	0.0	0	0
Africa[f]	0.8	6316830	5242969
Total	100.0	774478440	642817105

[4] Approximately 83% of the doses shipped in the EU-EEA countries were administered; this proportion has been calculated considering, out of total number of vaccine doses distributed in the EU-EEA countries, the total number of vaccine doses administered as per report on https://qap.ecdc.europa.eu/public/extensions/COVID-19/vaccine-tracker.html#distribution-tab, as of 18 June 2021.

[5] Approximately 83.9% of the doses shipped in the US were administered; this proportion has been calculated considering, out of total number of vaccine doses distributed in the US, the total number of vaccine doses administered as per report on https://covid.cdc.gov/covid-data-tracker/#vaccinations, as of 18 June 2021.

[6] The Order Book is the most accurate tracker of shipment used as data source for all the Regions and Countries; US shipment data not available in the Order Book were taken from the Order Management Dashboard and data for Hong Kong, Macau and Germany were provided by BioNTech.

[7] Including data from license partners.

Table 45. Cumulative Estimated Shipped and Administered Doses of COMIRNATY by Region Worldwide, through 18 June 2021

Region/Country/Other	% of Doses	Total Number of Shipped Doses	Total Number of Administered Doses

a. Conditional approval.
b. Includes:
UK, with both authorisation for emergency supply under regulation 174 and the conditional marketing authorisation approval,
Albania, Kosovo, North Macedonia and Switzerland with conditional approval,
Georgia, Serbia and Ukraine with authorization for emergency supply,
Azerbaijan, Bosnia and Moldova where BNT162b2 was shipped for COVAX,
Turkey where it was shipped according to a pharmacovigilance agreement in place by the MAH and the Turkish government.
c. Authorization for emergency supply.
d. Includes:
Brazil and Peru with conditional approval,
Chile, Colombia, Costa Rica, Dominican Republic, Ecuador, El Salvador, Honduras, Mexico, Panama and Uruguay with authorisation for emergency supply,
Bolivia where BNT162b2 was shipped for COVAX;
e. Includes:
Hong Kong, Malaysia and South Korea with conditional approval,
Bahrain, Iraq, Israel, Jordan, Kuwait, Lebanon, Macau, Oman, Palestine, Pakistan, Qatar, Saudi Arabia, Singapore, Sri Lanka and United Arab Emirates with authorization for emergency supply,
Bangladesh, Bhutan, Laos, Maldives, Mongolia, Philippines and West Bank & Gaza where BNT162b2 was shipped for COVAX;
f. Includes:
Rwanda, Tunisia and South Africa where BNT162b2 received authorisation for emergency supply,
Angola, Botswana, Cape Verde, Chad, Ivory Coast, Libya and Togo where BNT162b2 was shipped for COVAX.

Out of the total shipped and administered doses, 213,475,665 and 177,184,802 respectively, were shipped to Rest of World (Non-EEA countries, Canada, Central and South America, Asian countries [excluding Japan], Oceania and Africa).

The EEA published data (number of administered doses, number of doses administered as 1st dose and 2nd dose by country)[8] are summarized in Table 46.

[8] Approximately 83% of the doses shipped in the EU-EEA countries were administered; this proportion has been calculated considering, out of total number of vaccine doses distributed in the EU-EEA countries, the total number of vaccine doses administered as per report on https://qap.ecdc.europa.eu/public/extensions/COVID-19/vaccine-tracker.html#distribution-tab, as of 18 June 2021.

SV.1.2. Exposure

Not applicable.

Module SVI. Additional EU Requirements for the Safety Specification

Potential for misuse for illegal purposes

COVID-19 mRNA vaccine does not have characteristics that would make it attractive for use for illegal purposes; therefore, there is only a low potential for COVID-19 mRNA vaccine misuse for illegal purposes.

Module SVII. Identified and Potential Risks

In accordance with EMA RMP guidance for COVID-19 vaccines, the below factors were taken into consideration for the generation of the safety specification and are not determined to be identified or potential risks.

- **The vaccine construct and the formulation**. The COVID-19 mRNA vaccine consists of non-infectious, non-replicating RNA in a lipid-based formulation, which delivers the RNA to cells in the immunised person. Protein expression from the RNA is transient, and as is RNA itself. There is no systemic toxicity associated with the LNP or its metabolism (Study reports 38166 and 20GR142). Vacuolation of hepatocytes was observed in rat toxicity studies and believed to be associated with the uptake of the LNP and was without evidence of any effect on liver function. The liver vacuolation was reversed approximately 3-weeks after the last administration.

- **The degradation of the active substance / antigen and potential impact on safety related to this; (e.g. for mRNA-based vaccines).** Like endogenous mRNA in the cytosol, vaccine RNA in cytosol is degraded. The COVID-19 mRNA contains no known toxic products of the degradation of the RNA or the lipids in the formulation.

- **The vaccine does not contain an adjuvant**.

SVII.1. Identification of Safety Concerns in the Initial RMP Submission

The safety concerns of COVID-19 mRNA vaccine in the initial RMP are listed in Table 48.

Table 48. Summary of Safety Concerns

Important Identified Risks	Anaphylaxis
Important Potential Risks	Vaccine-associated enhanced disease (VAED) including Vaccine-associated enhanced respiratory disease (VAERD)
Missing Information	Use in pregnancy and while breast feeding
	Use in immunocompromised patients
	Use in frail patients with co-morbidities (e.g. chronic obstructive pulmonary disease [COPD], diabetes, chronic neurological disease, cardiovascular disorders)
	Use in patients with autoimmune or inflammatory disorders
	Interaction with other vaccines
	Long term safety data

SVII.1.1. Risks not Considered Important for Inclusion in the List of Safety Concerns in the RMP

Not all potential or identified risks for the vaccine are considered to meet the level of importance necessitating inclusion in the list of safety concerns in the RMP.

Reasons for not including an identified or potential risk in the list of safety concerns in this RMP include:

Risks with minimal and temporary clinical impact on patients (in relation to the severity of the disease prevented).

The following reactogenicity events are identified risks not considered as Important: Injection site pain, Injection site swelling and Injection site redness, Pyrexia, Chills, Fatigue, Headache, Myalgia, and Arthralgia.

Very rare potential risks for any medicinal treatment, including vaccines, which are well known to healthcare professionals are not included in the list of safety concerns.

In acknowledgment of the EMA core RMP19 guidance, the reactogenicity profile of COVID-19 mRNA vaccine is discussed below with respect to observed differences in solicited reactogenicity systemic events between Dose 1 and Dose 2. The observed differences do not impact the safety profile of the vaccine and are not proposed to be included in the list of safety concerns, rather they are discussed for completeness in the presentation of the safety profile.

Reactogenicity

Participants 16 years of age and older

The reactogenicity data were collected by participants' e-diary for reporting prompted local reactions and systemic events for 7 days after each dose.

Local Reactions

- Phase 1, Study BNT162-01

Local reactions generally increased in frequency and/or severity with increasing dose level and number of doses of COVID-19 mRNA vaccine. Most local reactions were mild or moderate in severity and resolved within several days of onset. For COVID-19 mRNA vaccine, incidence of local reactions was generally less after each dose in the older group (56-85 years) compared with the younger group (18-55 years), and severity of reactions was similar between both age groups.

- Phase 3, Study C4591001

In the COVID-19 mRNA vaccine group, pain at the injection site was reported more frequently in the younger group (16-55 years) than in the older group (> 55 years), and frequency was similar after Dose 1 compared with Dose 2 of COVID-19 mRNA in the younger group (83.7% vs 78.3%) and in the older group (70.1% vs 66.1%).

In the COVID-19 mRNA vaccine group, frequencies of redness and swelling were similar in the younger and older age group after Doses 1 and 2. Frequencies of redness were similar after Dose 1 compared with Dose 2 of COVID-19 mRNA vaccine in the younger age group (5.4% vs 5.6%) and in the older age group (5.3% vs 7.2%). Frequencies of swelling were similar after Dose 1 compared with Dose 2 of COVID-19 mRNA vaccine in the younger age group (6.3% vs 6.8%, respectively) and in the older age group (7.0% vs 7.8%). In the placebo group, redness and swelling were reported infrequently in the younger (≤1.0%) and older (≤1.2%) groups after Doses 1 and 2.

Overall, across age groups, pain at the injection site did not increase after Dose 2, and redness and swelling were generally similar in frequency after Dose 1 and Dose 2. Severe redness and swelling were reported infrequently and were similar between the younger and older age groups (≤0.7) after any dose. Severe pain at the injection site occurred more frequently in the younger age group compared to the older age group (2.5% vs 0.7%). After the first and second dose and in both age groups, the majority of local reactions were mild or moderate in severity, and no Grade 4 local reactions were reported.

The median onset for local reactions after either dose was between Day 1.0 and Day 2.0 (Day 1.0 was the day of vaccination) in the younger age group and between Day 1.0 and Day 3.0 in the older age group. Local reactions resolved with median durations between 1.0 and 2.0 days in both age groups.

For local reactions the frequency of redness, swelling, and pain at the injection site after any dose of COVID-19 mRNA vaccine was 8.5%, 10.2%, and 80.2% compared with 9.9%, 11.1%, and 84.5% for those SARS-CoV-2 positive and negative at baseline, respectively. While the frequency of local reactions was numerically higher in those negative at baseline, these differences are not clinically meaningful.

Systemic Events

- Phase 1, Study BNT162-01

Systemic events generally increased in frequency and/or severity with increasing dose level and number of doses of COVID-19 mRNA vaccine. Most systemic events were mild or

moderate, arose within the first 1 to 2 days after dosing, and were short-lived. For COVID-19 mRNA vaccine, the incidence of systemic events after each dose was similar in the older group (56-85 years) compared with the younger group (18-55 years). Reports of severe systemic events were similar between the younger and older COVID-19 mRNA vaccine groups.

- Phase 3, Study C4591001

Systemic events were generally increased in frequency and severity in the younger group (16-55 years of age) compared with the older group (>55 years), with frequencies and severity increasing with number of doses (Dose 1 vs Dose 2). Vomiting and diarrhoea were exceptions, which were reported similarly infrequently in both age groups and at similar incidences after each dose.

Systemic events in the younger group compared with the older group, with frequencies increasing with number of doses (Dose 1 vs Dose 2), were:

- fatigue: younger group (49.4% vs 61.5%) compared to older group (33.7% vs 51.0%)
- headache: younger group (43.5% vs 54.0%) compared to older group (25.0% vs 39.4%)
- myalgia: younger group (22.9% vs 39.3%) compared to older group (13.6% vs 28.9%)
- chills: younger group (16.5% vs 37.8%) compared to older group (6.5% vs 23.4%)
- arthralgia: younger group (11.8% vs 23.8%) compared to older group (8.7% vs 19.0%)
- pyrexia: younger group (4.1% vs 16.4%) compared to older group (1.3% vs 11.8%)
- vomiting: younger group (1.2% vs 2.2%) compared to the older group (0.5% vs 0.7%)
- diarrhoea: younger group (10.7% vs 10.0%) compared to the older group (8.4% vs 8.2%).

Systemic events were generally reported less frequently in the placebo group than in the COVID-19 mRNA vaccine group, for both age groups and doses, with some exceptions. In the younger age group, vomiting and diarrhoea (after Dose 1 and Dose 2) were reported at similar frequencies in the placebo group and the COVID-19 mRNA vaccine group. In the older age group, vomiting and diarrhoea (after Dose 1 and Dose 2) were reported at similar frequencies in the placebo group and the COVID-19 mRNA vaccine group.

Following both Dose 1 and Dose 2, use of antipyretic/pain medication was slightly less frequent in the older age group (19.0% vs 37.0%) than in the younger age group (27.8% vs 45.2%) after both doses, and medication use increased in both age groups after Dose 2 as compared with after Dose 1. Use of antipyretic/pain medication was less frequent in the placebo group than in the COVID-19 mRNA vaccine group and was similar after Dose 1 and Dose 2 in the younger and older placebo groups (ranging from 9.3% to 13.7%).

Severe pyrexia (>38.9°C to 40.0°C) increased in frequency with the number of doses (Dose 1 versus Dose 2) in younger (0.3% vs 1.5%) and older (0.0% vs 0.4%) participants who received COVID-19 mRNA vaccine and was reported in 0.1% of participants who received placebo in both age group after both doses. One participant in the younger COVID-19 mRNA vaccine group reported pyrexia of 41.2°C only on Day 2 after Dose 2 and was nonfebrile for all other days of the reporting period. Grade 4 pyrexia was not reported in the older COVID-19 mRNA vaccine group or in any placebo participants.

After the first and second dose and in both age groups, the majority of systemic events were mild or moderate in severity.

Systemic events in the younger and older age groups after either dose had a median onset day between Day 2.0 and Day 4.0 (Day 1.0 was the day of vaccination) and resolved with a median duration of 1 day in both age groups.

For any pyrexia (mild, moderate, severe or grade 4) after either dose there were 17.5% compared to 15.1% in those positive and negative for SARS-CoV-2 at baseline, respectively. Severe pyrexia (>38.9°C to 40.0°C) was reported in 0.6% participants and 1.0% participants in those positive and negative for SARS-CoV-2 at baseline, respectively. The frequency for other systemic events after any dose was numerically lower for those positive at baseline: fatigue, headache and chills the frequency was 54.2%, 49.7% and 32.8% compared with 65%, 57.4%, 34.7% for those positive and negative for SARS-CoV-2 at baseline, respectively. Arthralgia was another exception where 27.1% compared to 25.0% were reported between those positive and negative for SARS-CoV-2 at baseline. Note that the baseline SARS-CoV-2 positive subgroup included far fewer participants the negative subgroup, so their results should be interpreted with caution.

Participants 5 to <12 years of age

Phase 1 and Phase 2/3 participants or their parent/legal guardian were to monitor and record reactogenicity for 7 days after each dose; in the 5 to <12 years of age group, events included:

- **Local reactions:** pain, redness, swelling at the injection site

Overall, the pattern of local reactions reported in children 5 to <12 years of age after each dose was generally similar to that observed in prior analyses of Phase 2/3 participants ≥12 years of age in Study C4591001 with regard to pain at the injection site, but children had slightly higher frequencies of swelling and redness at the injection site (still within tolerable limits).

- **Systemic events:** fever, fatigue, headache, chills, vomiting, diarrhoea, new or worsened muscle pain, new or worsened joint pain

Overall, the pattern of systemic events reported in children 5 to <12 years of age after each dose was generally comparable to, or less than, that observed in prior analyses of Phase 2/3 participants ≥12 years of age in Study C4591001.

Adverse Events of Special Interest (AESI)

COVID-19 mRNA vaccine study C4591001 did not pre-specify AESI however, Pfizer utilizes a dynamic list of TME terms to be highlighted in clinical study safety data review. TMEs include events of interest due to their association with COVID-19 and terms of interest for vaccines in general and may include Preferred Terms, High Level Terms, High Level Group Terms or Standardised MedDRA Queries.

For the purpose of the RMP and summary safety reports, an AESI list was defined taking into consideration the available lists of AESIs from the following expert groups and regulatory authorities:

Brighton Collaboration (SPEAC)[91]

- ACCESS protocol[92]
- US CDC (preliminary list of AESI for VAERS surveillance)[93]
- MHRA (unpublished guideline).

The AESI list is comprised of medical conditions to allow for changes and customisations of MedDRA terms as directed by AE reports and the evolving safety profile of the vaccine. The terms searched in the safety database to identify cases of potential AESIs are presented by body system (e.g. Cardiovascular, Hepatic, Respiratory, etc.) when possible for ease of presentation. Medical concepts that are captured in the AESI list include:

- Immune and Autoimmune mediated events that are of interest for all vaccinations
- Events associated with severe COVID-19

The AESIs are taken in consideration for all routine and additional pharmacovigilance activities.

SVII.1.2. Risks Considered Important for Inclusion in the List of Safety Concerns in the RMP

Important Identified Risk: Anaphylaxis

Risk-benefit impact

Anaphylaxis is a serious adverse reaction that, although very rare, can be life-threatening.

Important Identified Risk: Myocarditis and Pericarditis

Risk-benefit impact

Myocarditis and pericarditis are serious conditions that may occur concomitantly and that may range in clinical importance from mild to life-threatening.

Important Potential Risk: Vaccine-Associated Enhanced Disease (VAED), including Vaccine-Associated Enhanced Respiratory Disease (VAERD)

Risk-benefit impact

Although not observed or identified in clinical studies with COVID-19 vaccines, there is a theoretical risk, mostly based on non-clinical betacoronavirus data, of VAED occurring either before the full vaccine regimen is administered or in vaccinees who have waning immunity over time. If VAED were to be identified as a true risk, depending on its incidence and severity, it may negatively impact the overall vaccine benefit risk assessment for certain individuals.

Missing Information: Use in Pregnancy and while breast feeding

Risk-benefit impact

The safety profile of the vaccine is not known in pregnant or breastfeeding women due to their initial exclusion from the pivotal clinical study, however one clinical study of the safety and immunogenicity of the COVID-19 vaccine in pregnant women is ongoing (C4591015); and 2 non-interventional studies (C4591009 and C4591011) to assess whether sub-cohorts of interest, such as pregnant women, experience increased risk of safety events of interest following receipt of the COVID-19 vaccine are approved.

It is important to obtain long term follow-up on women who were pregnant at or around the time of vaccination so that any potential negative consequences to the pregnancy can be assessed and weighed against the effects of maternal COVID-19 on the pregnancy.

Missing Information: Use in immunocompromised patients

Risk-benefit impact

The safety profile of the vaccine is not known in immunocompromised individuals due to their exclusion from the pivotal clinical study. The efficacy of the vaccine may be lower in

immunocompromised individuals, thus decreasing their protection from COVID-19. A non-interventional study [C4591024 (former Safety and immunogenicity in high-risk adults)] to evaluate the safety, tolerability, and immunogenicity of vaccine candidate BNT162b2 in immunocompromised participants ≥2 years of age is approved.

Missing Information: Use in frail patients with co-morbidities (e.g. chronic obstructive pulmonary disease (COPD), diabetes, chronic neurological disease, cardiovascular disorders)

Risk-benefit impact

There is limited information on the safety of the vaccine in frail patients with co-morbidities who are potentially at higher risk of severe COVID-19.

Missing Information: Use in patients with autoimmune or inflammatory disorders

Risk-benefit impact

There is limited information on the safety of the vaccine in individuals with autoimmune or inflammatory disorders and a theoretical concern that the vaccine may exacerbate their underlying disease.

Missing Information: Interaction with other vaccines

Risk-benefit impact

COVID-19 mRNA vaccine will be used in individuals who also may receive other vaccines. Studies to determine if co-administration of COVID-19 mRNA vaccine with other vaccines may affect the efficacy or safety of either vaccine have not been performed. One protocol study (C4591030 - *Co-administration study with seasonal influenza vaccine*) is planned.

Missing Information: Long term safety data

Risk-benefit impact

The long-term safety of COVID-19 mRNA vaccine is unknown at present, however further safety data are being collected in ongoing Study C4591001 for up to 2 years following administration of dose 2 of COVID-19 mRNA vaccine and 2 non-interventional studies (C4591036 and C4591038) are planned.

SVII.2. New Safety Concerns and Reclassification with a Submission of an Updated RMP

Not applicable.

SVII.3. Details of Important Identified Risks, Important Potential Risks, and Missing Information

SVII.3.1. Presentation of Important Identified Risks and Important Potential Risks

SVII.3.1.1. Important Identified Risk: Anaphylaxis

Table 49. Anaphylaxis

<table>
<tr><td>Potential mechanisms, evidence source and strength of evidence</td><td>Interaction of an allergen with IgE on basophils and mast cells triggers release of histamine, leukotrienes and other mediators that cause diffuse smooth muscle contraction and vasodilation with plasma leakage. This can manifest clinically with dyspnea, hypotension, swelling (sometimes leading to airway compromise), and rash (including hives).</td></tr>
<tr><td>Characterisation of the risk</td><td>
Participants 5 to <12 years of age[a]

<u>Data from the CT dataset (study C4591007)</u>

Anaphylactic reaction/shock, Anaphylactoid reaction/shock were not observed through the cut-off date of 06 September 2021.

<u>Data from the safety database:</u>

Through 18 June 2021, there were no cases reporting Anaphylactic reaction/shock, Anaphylactoid reaction/shock involving individuals 5 to <12 years of age.

Participants 12 to 15 years of age[a]

<u>Data from the CT database</u>[b]

Through 18 June 2021 there were no cases reporting Anaphylactic reaction/shock, Anaphylactoid reaction/shock as SAEs from the CT dataset.
<u>Data from the safety database:</u>
Through 18 June 2021, there were 5 cases (4 anaphylactic reaction and 1 anaphylactic shock) in individuals 12 to 15 years of age; overall event seriousness and outcome are summarized below.
<table>

<tr><td>Outcome: Resolved/Resolving</td><td>3</td></tr>
<tr><td>Outcome: Not resolved</td><td>2</td></tr>
</table>

Participants 16 years of age and older[a]
<u>Data from the CT database</u>[b]<u>:</u>
Through 18 June 2021, there was 1 case from the CT dataset, from Phase 3 clinical study C4591001, of serious Anaphylactoid reaction in a 17-year-old participant reported as resolved and deemed related to study treatment by the Investigator.

<u>Data from the safety database</u>
Through DLP 18 June 2021 there were 3822 cases (1.2% of the total post authorization dataset) reporting a total of 3914 events in individuals 16 years and older including:
Anaphylactic reaction (3414), Anaphylactic shock (420), Anaphylactoid rection (75) and Anaphylactoid shock (5).

Overall event seriousness and outcome are summarized below.
</td></tr>
</table>

Table 49. Anaphylaxis

Characterisation of the risk ***(Cont'd)***	<table><tr><th></th><th>Total Events N = 3914 (%)</th></tr><tr><td>Serious events</td><td>3868 (98.8)</td></tr><tr><td>Events with Criterion of Hospitalization</td><td>1231 (31.5)</td></tr><tr><td colspan="2">Distribution of events by Outcome</td></tr><tr><td>Outcome: Death</td><td>28 (0.7)</td></tr><tr><td>Outcome: Resolved/Resolving</td><td>2958 (75.6)</td></tr><tr><td>Outcome: Not resolved</td><td>171 (4.4)</td></tr><tr><td>Outcome: Resolved with sequelae</td><td>56 (1.4)</td></tr><tr><td>Outcome: Unknown</td><td>704 (18)</td></tr></table> Conclusion: Evaluation of cases of Anaphylactic reaction/shock, Anaphylactoid reaction/shock through 18 Jun 2021, did not reveal any significant new safety information. Anaphylaxis is appropriately described in the product labeling as are non-anaphylactic hypersensitivity events. Surveillance will continue.
Risk factors and risk groups	Known hypersensitivity to any components of the vaccine.
Preventability	Prevention of anaphylaxis may not be possible, particularly with the 1st dose of a vaccine; therefore, healthcare professionals administering the vaccine must be vigilant for early signs and symptoms.
Impact on the risk-benefit balance of the biologic product	Anaphylactic reaction in an individual can be impactful (medically important) because it is a potentially life-threatening event requiring medical intervention.
Public health impact	Minimal due to rarity of the event. Although the potential clinical consequences of an anaphylactic reaction are severe, this is a known risk of vaccines to healthcare professionals with negligible public health impact.

a. Search criteria starting from the 6th SMSR (see 5th Monthly Safety Update preliminary PRAC Assessment Report; EMEA/H/C/005735/MEA/002.4): PTs *Anaphylactic reaction, Anaphylactic shock, Anaphylactoid reaction, Anaphylactoid shock*, without Brighton Collaboration criteria applied.
b. Please note that CT dataset from the safety database includes only cases reporting SAEs.

Table 50. Myocarditis and Pericarditis

<table>
<tr><td>Potential mechanisms, evidence source and strength of evidence</td><td>A mechanism of action (MOA) by which the vaccine could cause myocarditis and pericarditis has not been established. Nonclinical studies, protein sequence analyses and animal studies in rats and non-human primates have not identified a MOA. Hypotheses for MOA include an immune stimulated response (including the possibility of molecular mimicry), a general systemic inflammatory response from vaccination or a hypersensitivity response.</td></tr>
<tr><td>Characterisation of the risk</td><td>
Participants 5 to <12 years of age[a]

Data from the CT dataset (study C4591007):

Myocarditis and Pericarditis were not observed through the cut-off date of 06 September 2021.

Data from the safety database:

Through 18 June 2021, there were no cases reporting myocarditis/pericarditis involving individuals 5 to 11 years of age.

Participants 12 to 15 years of age[a]

Data from the CT dataset[b]:
There were no cases reporting Myocarditis or Pericarditis as SAE in the clinical trial dataset through the cut-off date of 18 June 2021.

Data from the safety dataset:
Since the first temporary authorization for emergency supply under Regulation 174 in the UK (01 December 2020) and through 18 June 2021, there were 15 potentially relevant cases of Myocarditis and Pericarditis: 13 cases reported myocarditis and 4 cases reported pericarditis (in 2 of these 15 cases, the subjects developed both myocarditis and pericarditis).

Myocarditis (13 cases)

These 13 cases were individually reviewed and assessed according to Brighton Collaboration (BC) Myocarditis Case Definition and Level of Certainty Classification (version 1.4.2, 30 May 2021), as per table below:
<table>
<tr><th>Brighton Collaboration Level</th><th>Number of cases</th></tr>
<tr><td>BC 1</td><td>0</td></tr>
<tr><td>BC 2</td><td>0</td></tr>
<tr><td>BC 3</td><td>0</td></tr>
<tr><td>BC 4</td><td>11</td></tr>
<tr><td>BC 5</td><td>2</td></tr>
<tr><td>Total</td><td>13</td></tr>
</table>
Level 1 indicates a definitive case with the highest level of diagnostic certainty of myocarditis, level 2 indicates a probable case, and level 3 indicates a possible case. Level 4 is defined as “reported event of myocarditis with insufficient evidence to meet the case definition” and Level 5 as not a case of myocarditis.

No cases met BC levels 1 to 3. Overall event seriousness and outcome of the 11 cases meeting BC Level 4 cases are summarized below.
</td></tr>
</table>

Table 50. Myocarditis and Pericarditis

	Total Events N = 11
Serious events	10
Events with Criterion of Hospitalization	9
Distribution of events by Outcome	
Outcome: Death	0
Outcome: Resolved/Resolving	3
Outcome: Not resolved	4
Outcome: Resolved with sequelae	0
Outcome: Unknown/No data	4

Pericarditis (4 cases)

Overall event seriousness and outcome of these 4 cases are summarized below.

	Total Events N = 4
Serious events	3
Events with Criterion of Hospitalization	1
Distribution of events by Outcome	
Outcome: Death	0
Outcome: Resolved/Resolving	1
Outcome: Not resolved	1
Outcome: Resolved with sequelae	0
Outcome: Unknown/No data	2

Participants 16 years of age and older[a]

Data from the CT dataset[b]

There were two cases reporting myocarditis and pericarditis as SAEs in the clinical trial dataset through the cut-off date of 18 June 2021. These cases originated from Phase 3 clinical study C4591001 and are summarized below:

Myocarditis: there were no cases of myocarditis as SAE.

Pericarditis (2 cases): Two (2) serious adverse events [PT Pericarditis] were reported, both deemed not related to study treatment by the Investigator.

Data from the safety dataset:

Since the first temporary authorization for emergency supply under Regulation 174 in the UK (01 December 2020) and through 18 June 2021, there were 823 potentially relevant cases (0.3% of the total post-authorization dataset): 490 cases reported myocarditis and 371 cases reported pericarditis (in 38 of these 823 cases, the subjects were reported to have developed both myocarditis and pericarditis).

Myocarditis (490 cases):

These 490 cases were individually reviewed and assessed according to BC Myocarditis Case Definition and Level of Certainty Classification (version 1.4.2, 30 May 2021), as shown in the table below:

Table 50. Myocarditis and Pericarditis

Brighton Collaboration Level	Number of cases
BC 1	41
BC 2	44
BC 3	42
BC 4	337
BC 5	26
Total	490

Level 1 indicates a definitive case with the highest level of diagnostic certainty of myocarditis, level 2 indicates a probable case, and level 3 indicates a possible case. Level 4 is defined as "reported event of myocarditis with insufficient evidence to meet the case definition" and Level 5 as not a case of myocarditis.

There were 464 cases meeting BC Level 1 to 4, which are presented below:
Reported relevant PTs: Myocarditis (463) and Autoimmune myocarditis (1).

Overall event seriousness and outcome of these 464 cases are summarized below.

	Total Events N = 464 (%)
Serious events	459 (98.9)
Events with Criterion of Hospitalization	337 (72.6)
Distribution of events by Outcome	
Outcome: Death	14 (3.0)
Outcome: Resolved/Resolving	149 (32.1)
Outcome: Not resolved	106 (22.8)
Outcome: Resolved with sequelae	10 (2.2)
Outcome: Unknown/No data	185 (39.9)

Pericarditis (371 cases)

Reported relevant PTs: Pericarditis (360) and Pleuropericarditis (12).
Overall event seriousness and outcome of these 371 cases are summarized below.

	Total Events N = 372 (%)
Serious events	370 (99.5)
Events with Criterion of Hospitalization	206 (55.4)
Distribution of events by Outcome	
Outcome: Death	3 (0.8)
Outcome: Resolved/Resolving	213 (57.3)
Outcome: Not resolved	63 (16.9)
Outcome: Resolved with sequelae	7 (1.9)
Outcome: Unknown/No data	86 (23.1)

Conclusion: the MAH has updated the labels to include information about myocarditis and pericarditis following vaccine administration; a Direct Healthcare Professional Communication (DHPC) to address these findings was distributed. Surveillance will continue.

Risk factors and risk groups	Post-authorization reports have been received for more males than females, over a wide age range and following dose 1 and dose 2 of the vaccine. Evaluation by the EU and US CDC has found reports to be most frequent in adolescent and young adult male patients following the second dose of vaccine.
Preventability	Due to an unknown MOA, preventative measures cannot be indicated.

Table 50. Myocarditis and Pericarditis

Impact on the risk-benefit balance of the biologic product	The vaccine continues to have a favorable risk benefit balance.
Public health impact	Considering the low rates of myocarditis and pericarditis reported following vaccination, balanced with the risk of death and illness (including myocarditis) caused by SARS-CoV-2, the public health impact of post-vaccination myocarditis and pericarditis is minimal.

a. Search criteria: the following PTs were used to retrieve cases of Myocarditis and Pericarditis: Autoimmune myocarditis; Eosinophilic myocarditis; Giant cell myocarditis; Hypersensitivity myocarditis; Immune-mediated myocarditis; Myocarditis; Autoimmune pericarditis, Pericarditis; Pericarditis adhesive; Pericarditis constrictive; Pleuropericarditis.
b. Please note that CT dataset from the safety database includes only cases reporting SAEs.

SVII.3.1.2. Important Potential Risk: Vaccine-Associated Enhanced Disease (VAED), including Vaccine-Associated Enhanced Respiratory Disease (VAERD)

Table 51. Vaccine-Associated Enhanced Disease (VAED), including Vaccine-Associated Enhanced Respiratory Disease (VAERD)

Potential mechanisms, evidence source and strength of evidence	This potential risk is theoretical because it has not been described in association with the COVID-19 mRNA vaccine or it has not been reported from any other late phase clinical trial of other human vaccine. Animal models of SARS-CoV-2 infection have not shown evidence of VAED after immunisation, whereas cellular immunopathology has been demonstrated after viral challenge in some animal models administered SARS-CoV-1 (murine, ferret and non-human primate models) or MERS-CoV (mice model) vaccines.[86,94] This potential risk has been included based on these animal data with these related betacoronaviruses. Historically, disease enhancement in vaccinated children following infection with natural virus has been observed with an inactivated respiratory syncytial virus vaccine.[95] Potential mechanisms of enhanced disease may include both T cell-mediated [an immunopathological response favouring T helper cell type 2 (T_h2) over T helper cell type 1 (T_h1)] and antibody-mediated immune responses (antibody responses with insufficient neutralizing activity leading to formation of immune complexes and activation of complement or allowing for Fc-mediated increase in viral entry to cells).[96]
Characterisation of the risk	***Participants 5 to <12 years of age***[a] **Data from the CT database (study C4591007):** VAED including VAERD were not observed through the cut-off date of 06 September 2021. **Data from the safety database:** Through 18 June 2021, there were no cases reporting VAED/VAERD involving individuals 5 to < 12 years of age. ***Participants 12 to 15 years of age***[a] **Data from the CT database**[b] There were no cases reporting VAED/VAERD as SAEs in the CT dataset[a] through the DLP of 18 June 2021. **Data from the safety database:** Through 18 June 2021, there were no cases indicative of VAED or VAERD in the safety database involving individuals 12 to 15 years of age. ***Participants 16 years of age and older***[a] **Data from the CT database**[b]**:** There were no cases indicative of VAED/VAERD as SAEs in the CT dataset through the DLP of 18 June 2021. **Data from the safety database** Through 18 June 2021, there were 584 cases (0.2% of the total post-authorization dataset), reporting 1427 potentially relevant events. Seriousness criteria for the total 584 cases: Medically significant (452, of which 10 also serious for disability), Hospitalization required (non-fatal/non-life threatening)

Table 51. Vaccine-Associated Enhanced Disease (VAED), including Vaccine-Associated Enhanced Respiratory Disease (VAERD)

<table>
<tr><td>Characterisation of the risk
(Cont'd)</td><td>(115, of which 3 also serious for disability), Life threatening (34, of which 22 were also serious for hospitalization), Death (160).
Gender: Females (298), Males (268), Unknown (18);
Age (n=553) ranged from 17 to 103 years (mean = 70.3 years, median = 77.0);

Overall event seriousness and outcome are summarized below.

<table>
<tr><th></th><th>Total Events
N = 1427 (%)</th></tr>
<tr><td>Serious events</td><td>1261 (88.4)</td></tr>
<tr><td>Events with Criterion of Hospitalization</td><td>612 (42.9)</td></tr>
<tr><td colspan="2">Distribution of events by Outcome[a]</td></tr>
<tr><td>Outcome: Death</td><td>311 (21.8)</td></tr>
<tr><td>Outcome: Resolved/Resolving</td><td>375 (26.3)</td></tr>
<tr><td>Outcome: Not resolved</td><td>246 (17.2)</td></tr>
<tr><td>Outcome: Resolved with sequelae</td><td>14 (1.0)</td></tr>
<tr><td>Outcome: Unknown/No data</td><td>484 (33.9)</td></tr>
<tr><td colspan="2">a. For the outcome count, the multiple Lowest Level Terms that code to the same PT within a case are counted and presented individually. Therefore, for selected PTs the total count of the event outcome may exceed the total number of events.</td></tr>
</table>
The most frequently reported relevant PTs (≥2%) were: Drug ineffective (390), Vaccination failure (194), Dyspnoea (180), COVID-19 pneumonia (179), Diarrhoea (111), Respiratory failure (52), Vomiting (50), Pulmonary embolism (33).

Conclusion: VAED may present as severe or unusual clinical manifestations of COVID-19, overall, there were 425 subjects with confirmed COVID 19 following one or both doses of the vaccine; 288 of the 425 cases were severe, resulting in hospitalization, disability, life threatening consequences or death. None of the 288 cases could be definitively considered as VAED/VAERD.

The review of subjects with COVID-19 following vaccination, based on the current evidence, VAED/VAERD may remain a theoretical risk for the vaccine. Surveillance will continue.</td></tr>
<tr><td>Risk factors and risk groups</td><td>It is postulated that the potential risk may be increased in individuals producing lower neutralizing antibody titers or in those demonstrating waning immunity.[96]</td></tr>
</table>

Table 51. Vaccine-Associated Enhanced Disease (VAED), including Vaccine-Associated Enhanced Respiratory Disease (VAERD)

Preventability	An effective vaccine against COVID-19 that produces high neutralizing titers and a T_H1 predominant $CD4^+$ T cell response and strong $CD8^+$ T cell response, is expected to mitigate the risk of VAED/VAERD;[86,96] that immune profile is elicited by COVID-19 mRNA vaccine in clinical and preclinical studies.[97,98]
Impact on the risk-benefit balance of the biologic product	If there were an unfavourable balance in COVID-19 cases, including severe cases, in the pivotal clinical study between the vaccine and placebo groups, that may signal VAED/VAERD.
Public health impact	The potential risk of VAED/VAERD could have a public health impact if large populations of individuals are affected.

a. Search criteria for cases of potential VAED have been revised as compared to the RMP version 1.0. The revised search criteria are: Standard Decreased Therapeutic Response Search AND at least 1 of the following PTs Dyspnoea; Tachypnoea; Hypoxia; COVID 19 pneumonia; Respiratory Failure; Acute Respiratory Distress Syndrome; Cardiac Failure; Cardiogenic shock; Acute myocardial infarction; Arrhythmia; Myocarditis; Vomiting; Diarrhoea; Abdominal pain; Jaundice; Acute hepatic failure; Deep vein thrombosis; Pulmonary embolism; Peripheral Ischaemia; Vasculitis; Shock; Acute kidney injury; Renal failure; Altered state of consciousness; Seizure; Encephalopathy; Meningitis; Cerebrovascular accident; Thrombocytopenia; Disseminated intravascular coagulation; Chillblains; Erythema multiforme; Multiple organ dysfunction syndrome; Multisystem inflammatory syndrome in children;

Note: the "Standard Decreased Therapeutic Response" search include the Lack of efficacy PTs (Drug ineffective/Vaccination failure).
b. Please note that CT dataset from the safety database includes only cases reporting SAEs.

SVII.3.2. Presentation of the Missing Information

Table 52. Use in Pregnancy and while Breast Feeding

Evidence source:
The safety profile of the vaccine is not known in pregnant or breastfeeding women due to their initial exclusion from the pivotal clinical study. There may be pregnant women who choose to be vaccinated despite the lack of safety data. It will be important to follow these women for pregnancy and birth outcomes. The timing of vaccination in a pregnant woman and the subsequent immune response may have varying favourable or unfavourable impacts on the embryo/foetus. The clinical consequences of SARS-CoV-2 infection to the woman and foetus during pregnancy is not yet fully understood and the pregnant woman's baseline health status may affect both the clinical course of her pregnancy and the severity of COVID-19. These factors and the extent to which the pregnant woman may be at risk of exposure to SARS-CoV-2 will influence the benefit risk considerations for use of the vaccine.

Population in need of further characterization:
The lack of data is communicated in product labelling; for clinical study of the safety and immunogenicity of COVID-19 mRNA vaccine in pregnant women and while breast feeding, see PART III.2 and PART III.3.

Table 53. Use in Immunocompromised Patients

Evidence source:
The vaccine has not been studied in individuals with overt immunocompromised conditions. Therefore, further safety data will be sought in this population.

Population in need of further characterisation:
Safety data will be collected in individuals with compromised immune function due to acquired or genetic conditions or conditions requiring the use of immunosuppressants as this population of individuals in the active surveillance studies and the clinical studies proposed by the MAH (see PART III.2 and PART III.3).

Table 54. Use in Frail Patients with Co-morbidities (e.g., chronic obstructive pulmonary disease (COPD), diabetes, chronic neurological disease, cardiovascular disorders)

Evidence source:
The vaccine has been studied in individuals with stable chronic diseases (e.g., hypertension, obesity), however it has not been studied in frail individuals with severe co-morbidities that may compromise immune function due to the condition or treatment of the condition. Therefore, further safety data will be sought in this population.

Population in need of further characterisation:
Safety data will be collected in individuals who are frail due to age or debilitating disease in the active surveillance studies and through routine pharmacovigilance (see PART III.2 and PART III.3).

Table 55. Use in Patients with Autoimmune or Inflammatory Disorders

Evidence source:
There is limited information on the safety of the vaccine in patients with autoimmune or inflammatory disorders.

Population in need of further characterisation:
Safety data will be collected in individuals with autoimmune or chronic inflammatory diseases, including those who may be on immunosuppressants in the active surveillance studies (see PART III.2 and PART III.3).

Table 56. Interaction with other Vaccines

Evidence source:
There are no data on interaction of COVID-19 mRNA vaccine with other vaccines at this time.

Population in need of further characterisation:
All reports describing interactions of COVID-19 vaccine with other vaccines per national recommendations in individuals will be collected and analysed as per routine PV activities. Interactions with commonly used non-COVID-19 vaccines, such as influenza vaccine, are proposed to be studied in a future clinical study (see PART III.2 and PART III.3).

Table 57. Long Term Safety Data

Evidence source:
At this time, 2-month post dose 2 safety data are available for approximately half of the patients who have received COVID-19 mRNA vaccine in Study C4591001. The study is ongoing.

Anticipated risk/consequence of missing information:
At the time of vaccine availability, the long-term safety of COVID-19 mRNA vaccine is not fully known, however there are no known risks with a potentially late onset. Data will continue to be collected from participants in ongoing study C4591001 for up to 2 years following the 2nd dose of vaccine. Additionally, active surveillance studies are planned to follow long-term safety in vaccine recipients for 2 years following Dose 2.

Module SVIII. Summary of the Safety Concerns

Table 58. Summary of Safety Concerns

Important Identified Risks	Anaphylaxis Myocarditis and Pericarditis
Important Potential Risks	Vaccine-associated enhanced disease (VAED) including Vaccine-associated enhanced respiratory disease (VAERD)
Missing Information	Use in pregnancy and while breast feeding
	Use in immunocompromised patients
	Use in frail patients with co-morbidities (e.g., chronic obstructive pulmonary disease [COPD], diabetes, chronic neurological disease, cardiovascular disorders)
	Use in patients with autoimmune or inflammatory disorders
	Interaction with other vaccines
	Long term safety data

PART III. PHARMACOVIGILANCE PLAN (INCLUDING POST-AUTHORISATION SAFETY STUDIES)

III.1. Routine Pharmacovigilance Activities

Routine pharmacovigilance activities for the lifecycle of a product are a critical component to the detection, assessment, understanding and mitigation of risks. Objectives of routine pharmacovigilance include having processes in place to assure the ongoing and timely collection, processing, follow-up, and analysis of individual AE reports and aggregate data globally, following global safety Standard Operating Procedures and regulatory guidance.

Pfizer, on behalf of the MAH, monitors the safety profile of its products, evaluates issues potentially impacting product benefit-risk profiles in a timely manner, and ensures that appropriate communication of relevant safety information is conveyed in a timely manner to regulatory authorities and other interested parties as appropriate and in accordance with international principles and prevailing regulations. Pfizer, on behalf of the MAH, gathers data for signal detection and evaluation commensurate with product characteristics.

Routine pharmacovigilance activities beyond the receipt and review of individual AE reports (e.g. ADRs) include:

- Data Capture Aids have been created for this vaccine. They are intended to facilitate the capture of clinical details about
  - the nature and severity of COVID-19 illness in individuals who have received the COVID-19 mRNA vaccine and is anticipated to provide insight into potential cases of vaccine lack of effect or VAED. The updated version of the DCA is provided in Annex 4;
  - potential anaphylactic reactions in individuals who have received the COVID-19 mRNA vaccine. The DCA is provided in Annex 4.
- Signal detection activities for the lifecycle of vaccines consist of individual AE assessment at case receipt, regular aggregate review of cases for trends and statistically disproportionately reported product-adverse event pairs. Aggregated and statistical reviews of data are conducted utilizing Pfizer's software interactive tools. Safety signal evaluation requires the collection, analysis and assessment of information to evaluate potential causal associations between an event and the product and includes subsequent qualitative or quantitative characterisation of the relevant safety risk to determine appropriate continued pharmacovigilance and risk mitigation actions. Signal detection activities for the COVID-19 mRNA vaccine, will occur on a weekly basis. In addition, observed versus expected analyses will be conducted as appropriate as part of routine signal management activity.
- Routine signal detection activities for the COVID-19 mRNA vaccine will include routine and specific review of AEs consistent with the AESI list provided in PART II.SVII.1.1 – *Risks not considered important for inclusion in the list of safety concerns in the RMP*.

- In addition, published literature is reviewed weekly for individual case reports and broader signal detection purposes.

- Regulatory authority safety alerts monitoring.

- The web-based AE reporting portal www.pfizersafetyreporting.com will be available for vaccine providers (e.g. pharmacists, nurses, physicians and others who administer vaccines) and recipients, to assist with anticipated high volume of reports (based on expectations of a large target population for vaccination). The portal will capture key adverse event data in the initial interaction and will provide automated intake into the Pfizer safety database via E2B for safety review.

- At the country level, the Pfizer Drug Safety Units perform routine pharmacovigilance activities including the collection of AEs from various sources and the reporting of AEs to the regulatory authority as per local regulatory guidelines.

- The serious adverse event (SAE)/product complaint (PC) Joint Report for Sterile Injectables is run monthly. In addition, the AE/PC Joint report and the AE/PC Lot/Lot profile Report is run quarterly and is a statistical report that identifies any data that could constitute a safety signal over time. The AE/PC Lot/Lot Profile report complements the monthly AE trending performed by Safety and the monthly PC trending performed by Product Quality.

Monthly summary safety reports

In addition to routine 6-monthly PSUR production, monthly summary safety reports are compiled to support timely and continuous benefit risk evaluations. Topics covered by monthly summary safety reports include:

- Interval and cumulative number of reports, stratified by report type (medically confirmed/not) and by seriousness (including fatal separately);
- Interval and cumulative number of reports, overall and by age groups and in special populations (e.g. pregnant women);
- Interval and cumulative number of reports per HLT and SOC;
- Summary of the designated medical events;
- Reports per EU country;
- Exposure data (including age-stratified);
- Changes to reference safety information in the interval, and current CCDS;
- Ongoing and closed signals in the interval;
- AESI reports – numbers and relevant cases;
- Fatal reports – numbers and relevant cases;
- Risk/benefit considerations.

The submission of monthly reports complements the submission of 6 monthly PSURs. The need and frequency of submission of such reports will be re-evaluated based on the available evidence from post-marketing after 6 months (6 submissions).

- Monthly reports and PSURs will include results of the observed versus expected analysis for AESI as appropriate and will present the results and details of the statistical approach.

Potential Medication Errors

This section is applicable to all formulations presented in the RMP.

Large scale public health approaches for mass vaccination may represent changes to standard vaccine treatment process, thereby potentially introducing the risk of medication errors related to: reconstitution and administration, vaccination scheme, storage conditions, errors associated with a multi-dose vial, different formulations, and once other COVID vaccines are available, confusion with other COVID vaccines. These potential medication errors are mitigated through the information in the SmPC and available educational materials for healthcare providers.

- SmPC (section 6.6) contains instructions for reconstitution and administration, vaccination scheme, and storage conditions of the formulations of the COVID-19 mRNA vaccine.

- A poster with step-by-step instruction for vaccine storage, vial differentiation, dose planning and preparation, and administration is available, which can be conspicuously displayed in settings where vaccine is to be administered for ongoing reference.

- Brochures for safe handling of the vaccine and dry ice will accompany vaccine shipments.

- A dosing card which provides information for vaccine storage, vial differentiation, dose planning, and administration is available, which is available for healthcare provider reference.

- Medical information call centers will be available for healthcare providers to obtain information on use of the vaccine.

- Traceability and Vaccination Reminder card (Annex 7) will be provided with the pre-printed manufacturer name, placeholder spaces for dates of vaccinations and batch/lot numbers as a mitigation effort for potential confusion between vaccines. (see Traceability for additional details).

These available resources will inform healthcare providers on the proper preparation and administration of various formulations of the vaccine and reduce the potential for medication error in the context of a mass vaccination campaign. Additionally, the patient information leaflet and Traceability and Vaccination Reminder card informs patients of the vaccine received so that a series is completed with the same product.

Vial Differentiation

PBS-Sucrose formulation

- The 30 micrograms/dose concentrate for dispersion for injection vial used in individuals 12 years of age and older has a purple flip off plastic cap and label differentiation factors that indicate how to dilute it. The vial label and the SmPC includes 'Dilute Before Use' printed. If attempted to not dilute with 1.8 mL sodium chloride 9 mg/mL (0.9%) solution, the user would only be able to extract approximately 1 dose instead of 6 doses as the filled volume is 0.45 mL.

Tris-Sucrose formulation

This drug product formulation is referred to as the 'Tris-Sucrose formulation' to emphasize the change in formulation buffer.

- The 30 micrograms/dose dispersion for injection vial used in individuals 12 years of age and older has a grey flip off plastic cap and label differentiation factors included within do not need to be diluted. The vial label and the SmPC include 'Do Not Dilute' printed. The vial label also includes a wide grey border as an additional differentiation factor. Further, if attempted to further dilute, a user would immediately experience resistance to addition of any further volume, as the filled volume is 2.25 mL and therefore, there is little remaining physical space to add additional diluent to the vial.

- The 10 micrograms/dose concentrate for dispersion for injection vial should be used only for children 5 to 11 years of age and the 10-µg RNA dose, dilution of the vaccine with 0.9% sodium chloride for injection is required, as follows: dilute the 1.3-mL filled vial with 1.3 mL 0.9% sodium chloride for injection to provide 10 doses at 10 µg RNA / 0.2 mL Injection volume. The vial has an orange plastic cap which is different from the Comirnaty 30 micrograms/dose concentrate for dispersion for injection vial that has a purple plastic cap and from the 30 micrograms/dose dispersion for injection vial that has a grey flip off plastic cap.

Various educational resources to inform HCPs on the proper preparation and differentiation will be available.

Traceability

The SmPC, includes instructions for healthcare professionals:

- to clearly record the name and batch number of the administered vaccine to improve traceability (section 4.4);

- to report any suspected adverse reactions including batch/Lot number if available (section 4.8).

Traceability is available for every shipping container of COVID mRNA vaccine, which are outfitted with a unique device that provides real-time monitoring of geographic location and

temperature 24 hours per day, 7 days per week. Each device will also trace the batch/lot of the associated shipment. The device is activated prior to shipment and information is transmitted wirelessly to Pfizer at a predefined cadence, on behalf of the MAH, until delivery to the vaccinator's practice site. A shipment quality report that indicates if the product is acceptable for immediate use is generated by Pfizer on behalf of the MAH and transmitted to the vaccinator's practice site upon pressing of the stop button on the data logger, or arrival notification from the carrier in combination with the data loggers location and/or light signal. Additionally, alarms and escalation/notification for excursions (per pre-defined specifications) are programmed into the device. These data may be used for the assessment of a safety signal.

The vaccine carton labelling also contains a 2-D barcode which has the batch/lot and expiry embedded within, should there be capability at a vaccination site to utilize this as an information source.

Further, Pfizer on behalf of the MAH, provides Traceability and Vaccination Reminder cards (Annex 7) to vaccinators that may be completed at the time of vaccination. The Traceability and Vaccination Reminder cards contain the following elements:

- Placeholder space for name of vaccinee;
- Vaccine brand name and manufacturer name;
- Placeholder space for due date and actual date of first and second doses, and associated batch/lot number;
- Reminder to retain the card and bring to the appointment for the second dose of the vaccine;
- QR code that links to additional information; and
- Adverse event reporting information.

In addition, to the Traceability and Vaccination Reminder cards, two stickers per dose, containing printed batch/lot information, were made available to support documentation of the batch/lot on the Traceability and Vaccination Reminder card and vaccinee medical records in mass vaccination centers. We also acknowledge that some EU member states may require utilisation of nationally mandated vaccination cards or electronic systems to document batch/lot number; therefore, the available Traceability and Vaccination Reminder cards and stickers with printed lot/batch information may not be utilized in all member states. The following milestones are proposed for the availability of the stickers with printed lot/batch information:

- Initial vaccine availability: Sufficient quantities of blank "Traceability and Vaccination Reminder cards" were made available to vaccinators in the member states where utilisation of a nationally mandated vaccination card is not required.

- 29 January 2021: In addition to the blank "Traceability and Vaccination Reminder cards", stickers with printed lot/batch information were made available to vaccinators at large scale (1000 subjects/day), mass vaccination sites in the member states where the national authority has not mandated another mechanism for documenting the lot/batch information.

- Projected 2022: Upon development and approval a of single-dose vials, pre-printed batch/lot stickers will be available to co-ship with each vaccine shipment.

Cold-Chain Handling and Storage

Multiple modalities will be utilised for quality assurance throughout shipment due to the required ultra-cold storage for COVID-19 mRNA vaccine.

- Each shipment of the vaccine is outfitted with a unique device that provides real-time monitoring of geographic location and temperature 24 hours per day, 7 days per week until delivery to a vaccinator's practice site. Alarms and escalation/notification to Pfizer on behalf of the MAH and/or to the recipient for excursions (per pre-defined specifications) are programmed into the device. Additionally, a shipment quality report that indicates if the product is acceptable for immediate use is generated by Pfizer and transmitted to the vaccinator's practice site.

- Joint adverse event and product complaint (including available batch/lot information) trending reviews occur routinely with Global Product Quality.

- Additionally, available educational materials for vaccinators will include information regarding proper handling of the shipment container as temporary storage, and handling/disposal of dry ice until the received shipment is either placed into an ultra-low temperature freezer, or is maintained in accord with pre-defined specifications in the shipment container as temporary storage (i.e. upon receipt of the shipment quality report noted above), as appropriate.

III.2. Additional Pharmacovigilance Activities

The MAH proposes the following 16 studies, of which 4 global, 5 in Europe only, 5 in US only, 1 in US and Canada and 1 in New Zealand. There are 6 Interventional studies (C4591001, C4591007, C4591015, BNT162-01 Cohort 13, C4591024 and 1 study for vaccine interactions), 2 Low-Interventional studies (WI235284 and WI255886) and 8 Non-Interventional studies (7 safety and 1 effectiveness), summarised in the table below and further detailed in Table 59 and Table 60.

Study Number	Country	Interventional/ Non-Interventional	Purpose
C4591001	Global	Interventional	Safety
C4591007	Global	Interventional	Safety
C4591015	Global	Interventional	Safety
C4591009	US	Non-Interventional	Safety
C4591010	EU	Non-Interventional	Safety
C4591011	US	Non-Interventional	Safety
C4591012	US	Non-Interventional	Safety
C4591021 (former ACCESS/VAC4EU)	EU	Non-Interventional	Safety
C4591038 (former C4591021 substudy)	EU	Non-Interventional	Safety
C4591036 (former Pediatric Heart Network)	US/CA	Non-Interventional	Safety
C4591014	US	Non-Interventional	Effectiveness[a]
WI235284	US	Low-Interventional[d]	Effectiveness[a]
WI255886	EU[b]	Low-Interventional[d]	Effectiveness[a]
BNT162-01 Cohort 13	EU	Interventional	Safety
C4591024[c] (former Safety and immunogenicity in high-risk adults)	Global	Interventional	Safety
C4591030 (Co-administration study with seasonal influenza vaccine)	NZ	Interventional	Safety

a. Vaccine effectiveness is not a safety concern.
b. United Kingdom.
c. Based on the outcome of procedures PAM-MEA-015.2 and PAM-MEA-016, and in particular based on the conclusions of the Assessment Report for the Post-Authorisation Measure MEA/015.2 and MEA/016 (EMA/CHMP/498689/2021) issued on 16 September 2021, the design of study C4591024 was agreed to satisfactorily cover the objectives initially planned for study C4591018, that is therefore removed from the list of studies
d. The study does not involve any administration of vaccine or other Pfizer products but since a specimen collection procedure is required per protocol, this qualifies this study as 'low-interventional'.

Non-Interventional Post Approval Safety Studies (7)

- The MAH proposes 7 complementary studies of real-world safety of COVID-19 mRNA vaccine that use multiple data sources and study designs. These are described in Table 59 below which includes the proposed post-approval safety studies that will be conducted in the EU and US.

- Study C4591010 will be conducted in the EU using primary data collection to monitor a cohort of vaccinees and evaluate risk of safety events of interest reflecting the AESI list.

- Study C4591021 is a Comirnaty safety surveillance study conducted in collaboration with University Medical Center Utrecht on behalf of Vaccine Monitoring Collaboration for Europe Consortium research team VAC4EU and based on the master surveillance protocol.

- Additionally, C4591038 (formally known as the C4591021 substudy) is also a collaboration with University Medical Center Utrecht on behalf of VAC4EU Consortium research team and is designed as a substudy of C4591021 to assess the natural history of post-vaccination myo-/pericarditis, e.g., recovery status (using medical record review) and/or identification of serious cardiovascular outcomes (using existing structured data) within 1 year of myo-/pericarditis diagnosis among occurring in individuals vaccinated with COMIRNATY as well as individuals not vaccinated with a COVID-19 vaccine.

- In addition to the studies in the EU, in support of the US EUA application, Pfizer will conduct 4 US studies for safety surveillance of COVID 19 mRNA. These studies include:

    - 1 study using secondary data from administrative claims/electronic medical records for military and civilian personnel and their families in the Department of Defense Military Health System (C4591011),

    - 1 study using secondary data from EHR of patients included in the Veterans Healthcare Administration system (C4591012).

    - 1 study using secondary data from administrative claims and electronic health records from data research partners participating in the US Sentinel System (C4591009).

    - 1 study using primary data from the Pediatric Heart Network (PHN), a NIH-funded consortium of hospitals to characterize the clinical course, risk factors, long-term sequelae, and quality of life in children and young adults <21 years with acute post-vaccine myocarditis over a 5-year period. A full protocol will be shared by 30 November 2021 (C4591036).

- The protocols for the safety studies in the US (C4591009, C4591011 and C4591012) were added in Annex 3 Part C.

Non-Interventional Post-Approval Safety Studies Assessing Myocarditis/Pericarditis

Studies C4591021(EU), C4591038 (former C4591021 substudy) (EU), C4591011 (US), C4591012 (US), and C4591009 (US) will describe the incidence of myocarditis/pericarditis following Comirnaty vaccination overall, and stratified by age group, gender, race/ethnicity (if feasible), dose, and risk interval using structured information and following case confirmation via medical record review where feasible. To assess the magnitude of risk, these studies include comparative methods (self-controlled analyses, and analyses involving a separate comparator group).

Relative risk (RR) estimates from comparative analyses will be obtained overall and stratified by the same factors as described above when supported by sufficient cell counts.

To evaluate long-term outcomes, myocarditis/pericarditis-specific analytic endpoints in currently planned or ongoing studies C4591009, C4591011, C4591012, C4591021 and C4591038 (former C4591021 substudy) will assess the natural history of post-vaccination myo-/pericarditis, e.g., recovery status (medical record review) and/or identification of serious cardiovascular outcomes (structured data) within 1 year of myo-/pericarditis diagnosis among individuals vaccinated with COMIRNATY as well as individuals not vaccinated with a COVID-19 vaccine.

In addition, a long-term primary data collection study is C4591036 (former Pediatric Heart Network (PHN), to evaluate the clinical course, risk factors, long-term sequelae, and quality of life of post-vaccine myocarditis/pericarditis over a 5-year period.

Finally, study C4591021 will also estimate the time trend, in relation to DHPC letter dissemination, of the proportion of individuals who received real-world clinical assessments for myocarditis/pericarditis following Comirnaty vaccination.

Non-Interventional Post-Approval Safety Studies that include paediatric subjects aged 5 to < 12 years old

Studies C4591021(EU), C4591038 (former C4591021 substudy) (EU), C4591009 (US) C4591011 (US) and C4591036 (US and Canada) will assess the use of vaccine for the occurrence of safety events of interest, including myocarditis and pericarditis. Each of these studies includes individuals of all ages, including ages 5 to <12, except for study C4591036, which only includes individuals <21 years of age.

Non-Interventional Post-Approval Safety Studies in Pregnancy

It is anticipated that initial use in pregnancy will be subject to local health authority recommendations regarding which individuals should be vaccinated and likely very limited intentional vaccination of pregnant women; therefore, initially this information will derive from 4 of the real-world safety studies (C4591009, C4591010, C4591011, and C4591021 [former ACCESS/VAC4EU]), described in Table 59. Study C4591012 is focused on patients

in the Veterans Health Administration system and is not expected to capture many pregnancies given the demographics of the source population.

The findings from studies' interim analysis (where planned) will inform a strategy to assess pregnancy outcomes as vaccination in pregnancy expands. The MAH will consider established EU pregnancy research recommendations such as CONSIGN (COVID-19 infectiOn aNd medicineS In pregnancy) when developing any pregnancy related study objectives (currently not listed in Table 59 and Table 60).

The MAH agrees that monitoring vaccine safety in pregnant women is critical. Given that a pregnancy registry based on primary data collection is susceptible to non-participation, attrition, small sample size and limited or lack of comparator data, Pfizer, on behalf of the MAH, would like to propose monitoring vaccine safety in pregnancy using electronic health care data, which could be conducted in a representative pregnant woman population exposed to the vaccine and minimize selection bias, follow-up bias, and reporting bias. In addition, internal comparison groups, such as contemporaneous unvaccinated pregnant women or women receiving other vaccine(s) to prevent COVID-19 (if available) could be included.

Post-Approval Effectiveness Studies (3)

Pfizer will conduct, on behalf of the MAA, at least one non-interventional study (test negative design) of individuals presenting to the hospital or emergency room with symptoms of potential COVID-19 illness in a real-world setting (C4591014). The effectiveness of COVID-19 mRNA vaccine will be estimated against laboratory confirmed COVID-19 illness requiring admission to the ED or hospital where SARS-CoV-2 is identified. This study will allow to determine the effectiveness of Pfizer's vaccine in a real-world setting and against severe disease, and in specific racial, ethnic, and age groups.

In February 2021, Pfizer has submitted to the FDA a Request for Comments and Advice regarding the study C4591014, a non-interventional study (test-negative design) of COVID-19 mRNA vaccine effectiveness. The purpose of the original study C4591014 has been further developed and 2 new vaccine effectiveness epidemiology studies not sponsored by Pfizer (WI235284 and WI255886) have been added. The harmonisation of study definitions across these 3 protocols will allow for data and results comparison across study populations to provide a robust evidence base for evaluating the effectiveness of COVID-19 mRNA vaccine following its introduction into the real-world setting.

Table 59. Additional Pharmacovigilance Activities

Study Number *Country (ies)*	Study Title Study Type *Study Status*	Rationale and Study Objectives	Study design	Study populations	Milestones	
C4591001 Global	A Phase 1/2/3, placebo-controlled, randomized, observer-blind, dose-finding study to evaluate the safety, tolerability, immunogenicity, and efficacy of SARS-COV-2 RNA vaccine candidates against COVID-19 in healthy individuals Interventional *Ongoing*	The objective of the study is to evaluate the safety, tolerability, immunogenicity and efficacy of COVID-19 mRNA vaccine An imbalance between the vaccine and control groups in the frequency of COVID-19 disease, in particular for severe COVID-19 disease, may indicate the occurrence of vaccine associated enhanced disease. Surveillance is planned for 2 years following Dose 2	Phase 1/2/3, randomised, placebo-controlled, observer-blind, dose-finding, vaccine candidate–selection, and efficacy study in healthy individuals.	Healthy men and women 18-55 and 65-85 years of age. Male and female, aged ≥ 12 years of age. Stable chronic conditions including stable treated HIV, HBV and HCV allowed, excluding immunocompromising conditions and treatments. Table 60. On-going and Planned Additional Pharmacovigilance Activities

Study (*study short name, and title*) Status (*planned/on-going*)	Country	Summary of Objectives	Safety concerns addressed	Milestone	Due dates
C4591036 (former Pediatric Heart Network Study) *Planned*	US/CA	To characterize the clinical course, risk factors, long-term sequelae, and quality of life in children and young adults <21 years with acute post-vaccine myocarditis	Myocarditis/pericarditis Long term safety data	Protocol submission:	30-Nov-2021
				Final CSR submission	31-Oct-2025
C4591030 (Co-administration study with seasonal influenza vaccine) *Planned*	Not available	Safety and immunogenicity of COVID-19 mRNA vaccine and quadrivalent seasonal influenza vaccine when administered separately or concomitantly.	Interaction with other vaccines.	Protocol submission	30-Sep-2021
				Final CSR submission:	31-Dec-2022

a. Case-control study nested in a prospective surveillance cohort, conducted as a research collaboration.
b. United Kingdom.

PART IV. PLANS FOR POST AUTHORISATION EFFICACY STUDIES

None.

PART V. RISK MINIMISATION MEASURES (INCLUDING EVALUATION OF THE EFFECTIVENESS OF RISK MINIMISATION ACTIVITIES)

RISK MINIMISATION PLAN

The safety information in the proposed product information is aligned to the reference medicinal product.

V.1. Routine Risk Minimisation Measures

The product information is sufficient to mitigate the current identified and potential risks of COVID-19 mRNA vaccine. The necessary information to ensure appropriate use of the product is included in the relevant sections of the SmPC. No additional measures for risk minimisation are considered necessary by the MAH at this time. The proposed minimisation measures are summarised in the table below for each safety concern.

Table 61. Description of Routine Risk Minimisation Measures by Safety Concern

Safety Concern	Routine risk minimisation activities
Important Identified Risk	
Anaphylaxis	Routine risk communication: SmPC section 4.4 Special warnings and precautions for use and section 4.8 Undesirable effects. Routine risk minimisation activities recommending specific clinical measures to address the risk: None. Other routine risk minimisation measures beyond the Product Information: None.
M**yocarditis and Pericarditis**	Routine risk communication: SmPC section 4.4 Special warnings and precautions for use and section 4.8 Undesirable effects. Routine risk minimisation activities recommending specific clinical measures to address the risk: None. Other routine risk minimisation measures beyond the Product Information: None
Important Potential Risk	
Vaccine-associated enhanced disease (VAED) including Vaccine-associated enhanced respiratory disease (VAERD)	Routine risk communication: None. Routine risk minimisation activities recommending specific clinical measures to address the risk: None. Other routine risk minimisation measures beyond the Product Information: None.

Table 61. Description of Routine Risk Minimisation Measures by Safety Concern

Missing Information	
Use in pregnancy and while breast feeding	Routine risk communication: SmPC section 4.6 Fertility, pregnancy and lactation PL section 2. What you need to know before you receive Comirnaty Routine risk minimisation activities recommending specific clinical measures to address the risk: None. Other routine risk minimisation measures beyond the Product Information: None.

Table 61. Description of Routine Risk Minimisation Measures by Safety Concern

Use in immunocompromised patients	Routine risk communication: SmPC section 4.4 Special warnings and precautions for use and section 5.1 Pharmacodynamic properties. Routine risk minimisation activities recommending specific clinical measures to address the risk: None. Other routine risk minimisation measures beyond the Product Information: None.
Use in frail patients with co-morbidities (e.g. chronic obstructive pulmonary disease [COPD], diabetes, chronic neurological disease, cardiovascular disorders)	Routine risk communication: SmPC section 5.1 Pharmacodynamic properties. Routine risk minimisation activities recommending specific clinical measures to address the risk: None. Other routine risk minimisation measures beyond the Product Information: None.
Use in patients with autoimmune or inflammatory disorders	Routine risk communication: None. Routine risk minimisation activities recommending specific clinical measures to address the risk: None. Other routine risk minimisation measures beyond the Product Information: None.
Interaction with other vaccines	Routine risk communication: SmPC section 4.5 Interaction with other medicinal products and other forms of interaction Routine risk minimisation activities recommending specific clinical measures to address the risk: None. Other routine risk minimisation measures beyond the Product Information: None.
Long-term safety data	Routine risk communication: None. Routine risk minimisation activities recommending specific clinical measures to address the risk: None. Other routine risk minimisation measures beyond the Product Information: None.

V.2. Additional Risk Minimisation Measures

The additional risk minimisation measure to address myocarditis and pericarditis is a Direct Healthcare professional communication, as below.

Table 62. Additional Risk Minimisation Measures for the Important Identified Risk of Myocarditis and Pericarditis

Direct Healthcare Professional Communication (DHPC)	
Objectives	To ensure that healthcare providers (HCPs) are aware of the potential for myocarditis and pericarditis associated with COVID-19 mRNA vaccine use.
Rationale for the additional risk minimisation activity:	The DHCP communication is to inform HCPs about the identified risk of myocarditis and pericarditis associated with COVID-19 mRNA vaccine, to remind them to be alerted about the signs and symptoms and to counsel patients to seek immediate medical attention should they experience chest pain, shortness of breath, or palpitations.
Target audience and planned distribution path:	The target audience includes general practitioners, cardiologists, specialists in emergency medicine and vaccination centres, HCPs who vaccinate patients and who provide medical care to patients who receive the vaccine. Target groups should be further defined at national level, depending on national health care systems.
Plans to evaluate the effectiveness of the interventions and criteria for success:	Estimating the time trend, in relation to DHPC letter dissemination, of the proportion of individuals who received real-world clinical assessments for myocarditis/pericarditis following Comirnaty vaccination. The DHPC distribution started on 19 July 2021 in all EEA countries as per the EMA's communication plan.

V.3. Summary of Risk Minimisation Measures

Table 63. Summary Table of Pharmacovigilance Activities and Risk Minimisation Activities by Safety Concern

Safety Concern	Risk Minimisation Measures	Pharmacovigilance Activities
Anaphylaxis	Routine risk minimisation measures: SmPC sections 4.4. and 4.8. Additional risk minimisation measures: None.	Routine pharmacovigilance activities beyond adverse reactions reporting and signal detection: DCA is intended to facilitate the capture of clinical details about potential anaphylactic reactions in individuals who have received the COVID-19 mRNA vaccine (PART III.1 and Annex 4). Additional pharmacovigilance activities: Studies (Final CSR Due Date): • C4591001 (31-Dec-2023) • C4591007 (31-Jul-2024) • C4591009 (31-Oct-2025) • C4591010 (30-Sep-2024) • C4591011 (31-Dec-2023) • C4591012 (31-Dec-2023)

Table 63. Summary Table of Pharmacovigilance Activities and Risk Minimisation Activities by Safety Concern

Safety Concern	Risk Minimisation Measures	Pharmacovigilance Activities
		• C4591021 (former ACCESS/VAC4EU) 30-Sep-2024).
Myocarditis and pericarditis	Routine risk minimisation measures: SmPC sections 4.4. and 4.8. Additional risk minimisation measures: DHCP letter and communication plan (see V.2 and Annex 6)	Routine pharmacovigilance activities beyond adverse reactions reporting and signal detection: None. Additional pharmacovigilance activities: Studies (Final CSR Due Date): • C4591009 (31-Oct-2025) • C4591011 (31-Dec-2023) • C4591012 (31-Dec-2023) • C4591021 (former ACCESS/VAC4EU) (30-Sep-2024). • C4591038 (former C4591021 substudy) (30-Sep-2024) • C4591036 [former Pediatric Heart Network study] (31-Oct-2025).
Vaccine-associated enhanced disease (VAED) including Vaccine-associated enhanced respiratory disease (VAERD)	Routine risk minimisation measures: None. Additional risk minimisation measures: No risk minimisation measures.	Routine pharmacovigilance activities beyond adverse reactions reporting and signal detection: DCA is intended to facilitate the capture of clinical details about the nature and severity of COVID-19 illness in individuals who have received the COVID-19 mRNA vaccine and is anticipated to provide insight into potential cases of vaccine lack of effect or VAED (PART III.1 and Annex 4). Additional pharmacovigilance activities: Studies (Final CSR Due Date) • C4591001 (31-Dec-2023) • C4591007 (31-Jul-2024) • C4591009 (31-Oct-2025) • C4591011[b] (31-Dec-2023) • C4591012[b] (31-Dec-2023) • C4591021 (former ACCESS/VAC4EU) (30 Sep-2024)[b].

Table 63. Summary Table of Pharmacovigilance Activities and Risk Minimisation Activities by Safety Concern

Safety Concern	Risk Minimisation Measures	Pharmacovigilance Activities
Use in pregnancy and while breast feeding	Routine risk minimisation measures: SmPC section 4.6; PL section 2. Additional risk minimisation measures: No risk minimisation measures.	Routine pharmacovigilance activities beyond adverse reactions reporting and signal detection: None. Additional pharmacovigilance activities: Studies (Final CSR Due Date) • C4591010[a](30-Sep-2024) • C4591009 (31-Oct-2025) • C4591011[a] (31-Dec-2023) • C4591015 (30-Apr-2023) • C4591021 (former ACCESS/VAC4EU)[a] (30-Sep-2024).
Use in immunocompromised patients	Routine risk minimisation measures: SmPC sections 4.4 and 5.1. Additional risk minimisation measures: No risk minimisation measures.	Routine pharmacovigilance activities beyond adverse reactions reporting and signal detection: None. a. Please note that studies C4591009, C4591010, C4591011 and C4591021 (former ACCESS/VAC4EU) address only "Use in pregnancy".
b. Addresses AESI-based safety events of interest including vaccine associated enhanced disease
c. Addresses AESI-based safety events of interest.

PART VI. SUMMARY OF THE RISK MANAGEMENT PLAN

Summary of risk management plan for Comirnaty.

This is a summary of the risk management plan (RMP) for Comirnaty. The RMP details important risks of Comirnaty, how these risks can be minimised, and how more information will be obtained about Comirnaty's risks and uncertainties (missing information).

Comirnaty's summary of product characteristics (SmPC) and its package leaflet give essential information to healthcare professionals and patients on how Comirnaty should be used.

This summary of the RMP for Comirnaty should be read in the context of all this information including the assessment report of the evaluation and its plain-language summary, all which is part of the European Public Assessment Report (EPAR).

Important new concerns or changes to the current ones will be included in updates of Comirnaty's RMP.

I. The Medicine and What It Is Used For

Comirnaty is a vaccine for active immunisation to prevent COVID-19 caused by SARS-CoV-2 virus, in individuals 5 years of age and older. (see SmPC for the full indication). It contains nucleoside-modified messenger RNA encapsulated in lipid nanoparticles as the active substance and it is given intramuscularly.

Further information about the evaluation of Comirnaty's benefits can be found in Comirnaty's EPAR, including in its plain-language summary, available on the EMA website, under the medicine's webpage www.ema.europa.eu/en/medicines/human/EPAR/comirnaty .

II. Risks Associated With the Medicine and Activities to Minimise or Further Characterise the Risks

Important risks of Comirnaty, together with measures to minimise such risks and the proposed studies for learning more about Comirnaty's risks, are outlined below.

Measures to minimise the risks identified for medicinal products can be:

- Specific Information, such as warnings, precautions, and advice on correct use, in the package leaflet and SmPC addressed to patients and healthcare professionals;
- Important advice on the medicine's packaging;
- The authorised pack size — the amount of medicine in a pack is chosen so to ensure that the medicine is used correctly;
- The medicine's legal status — the way a medicine is supplied to the patient (e.g. with or without prescription) can help to minimise its risks.

Together, these measures constitute *routine risk minimisation* measures.

In addition to these measures, information about adverse events is collected continuously and regularly analysed, including PSUR assessment so that immediate action can be taken as necessary. These measures constitute *routine pharmacovigilance activities*.

If important information that may affect the safe use of Comirnaty is not yet available, it is listed under 'missing information' below.

II.A List of Important Risks and Missing Information

Important risks of Comirnaty are risks that need special risk management activities to further investigate or minimise the risk, so that the medicinal product can be safely administered. Important risks can be regarded as identified or potential. Identified risks are concerns for which there is sufficient proof of a link with the use of Comirnaty. Potential risks are concerns for which an association with the use of this medicine is possible based on available data, but this association has not been established yet and needs further evaluation. Missing information refers to information on the safety of the medicinal product that is currently missing and needs to be collected (e.g. on the long-term use of the medicine).

Table 64. List of Important Risks and Missing Information

Important identified risks	Anaphylaxis Myocarditis and Pericarditis
Important potential risks	Vaccine-associated enhanced disease (VAED) including Vaccine-associated enhanced respiratory disease (VAERD)
Missing information	Use in pregnancy and while breast feeding
	Use in immunocompromised patients
	Use in frail patients with co-morbidities (e.g. chronic obstructive pulmonary disease [COPD], diabetes, chronic neurological disease, cardiovascular disorders)
	Use in patients with autoimmune or inflammatory disorders
	Interaction with other vaccines
	Long term safety data

II.B Summary of Important Risks

The safety information in the proposed Product Information is aligned to the reference.

Table 65. Important Identified Risk: Anaphylaxis

Evidence for linking the risk to the medicine	Events of anaphylaxis have been reported.
Risk factors and risk groups	Known allergy to the vaccine or its ingredients.
Risk minimisation measures	Routine risk minimisation measures SmPC sections 4.4. and 4.8. Additional risk minimisation measures: None.
Additional pharmacovigilance activities	Additional pharmacovigilance activities: • C4591001 • C4591007 • C4591009 • C4591010 • C4591011 • C4591012 • C4591021 (former ACCESS/VAC4EU) See Section II.C of this summary for an overview of the post-authorisation development plan.

Table 66. Important Identified Risk: Myocarditis and Pericarditis

Evidence for linking the risk to the medicine	Events of Myocarditis and Pericarditis have been reported.
Risk factors and risk groups	Post-authorization reports have been reported more frequently in adolescent and young adult male patients following the second dose of vaccine; however, reports have been received for adult males and females of broader age range and following the first vaccination also.
Risk minimisation measures	Routine risk minimisation measures SmPC sections 4.4. and 4.8. Additional risk minimisation measures: DHCP letter and communication plan
Additional pharmacovigilance activities	Additional pharmacovigilance activities: • C4591009 • C4591011 • C4591012 • C4591021 (former ACCESS/VAC4EU) • C4591038 (former C4591021 sub-study) • C4591036 (former Pediatric Heart Network study) See Section II.C this summary for an overview of the post-authorisation development plan.

Table 67. Important Potential Risk: Vaccine-Associated Enhanced Disease (VAED) including Vaccine-Associated Enhanced Respiratory Disease (VAERD)

Evidence for linking the risk to the medicine	VAED is considered a potential risk because it has not been seen in human studies with this or other COVID-19 vaccines being studied. It has not been seen in vaccine studies in animal models of the SARS-CoV-2 virus either. However, in selected vaccine studies in animal models as well as in some laboratory studies in animal cells infected with 2 other related coronaviruses (SARS-CoV-1 and MERS-CoV), abnormalities in immune responses or cellular responses indicative of VAED were observed. Because of this, VAED is considered a potential risk. In the past there have been other examples of particularly respiratory viruses where VAED has been observed. For example, some children who received an inactivated respiratory syncytial virus vaccine (a different type of virus), had worse signs of disease when they were subsequently infected with respiratory syncytial virus. VAED is thought to occur by several mechanisms where the immune response is not fully protective and actually either causes the body to have an inflammatory reaction due to the type of immune response with specific types of T-cells, or the body does not produce enough strong antibodies to prevent SARS-CoV-2 infection of cells or produces weak antibodies that actually bind to the virus and help it to enter cells more easily, leading to worse signs of disease.
Risk factors and risk groups	It is thought that the potential risk of VAED may be increased in individuals producing a weak antibody response or in individuals with decreasing immunity over time.
Risk minimisation measures	Routine risk minimisation measures None. Additional risk minimisation measures: None.
Additional pharmacovigilance activities	Additional pharmacovigilance activities: • C4591001 • C4591007 • C4591009[a] • C4591011[a] • C4591012[a] • C4591021 (former ACCESS/VAC4EU)[a] See Section II.C of this summary for an overview of the post-authorisation development plan.

a. Addresses AESI-based safety events of interest including vaccine associated enhanced disease

Table 68. Missing Information: Use in Pregnancy and while Breast Feeding

Risk minimisation measures	Routine risk minimisation measures: SmPC section 4.6; PL section 2. Additional risk minimisation measures: No risk minimisation measures.
Additional pharmacovigilance activities	Additional pharmacovigilance activities: • C4591009[a] • C4591010[a] • C4591011[a] • C4591015 • C4591021 (former ACCESS/VAC4EU)[a] See Section II.C of this summary for an overview of the post-authorisation development plan.

a. Please note that studies C4591009, C4591010, C4591011 and C4591021 (former ACCESS/VAC4EU) address only "Use in pregnancy".

Table 69. Missing Information: Use in Immunocompromised Patients

Risk minimisation measures	Routine risk minimisation measures: SmPC sections 4.4 and 5.1. Additional risk minimisation measures: No risk minimisation measures.
Additional pharmacovigilance activities	Additional pharmacovigilance activities: • BNT162-01 cohort 13 • C4591010[a] • C4591011 • C4591012 • C4591021 (former ACCESS/VAC4EU) • C4591024 (former Safety and Immunogenicity in high-risk adults) See Section II.C of this summary for an overview of the post-authorisation development plan.

a. Addresses AESI-based safety events of interest

Table 70. Missing Information: Use in Frail Patients with Co-morbidities (e.g. chronic obstructive pulmonary disease (COPD), diabetes, chronic neurological disease, cardiovascular disorders)

Risk minimisation measures	Routine risk minimisation measures: SmPC section 5.1. Additional risk minimisation measures: No risk minimisation measures.
Additional pharmacovigilance activities	Additional pharmacovigilance activities: • C4591001 subset • C4591011 • C4591012 • C4591021 (former ACCESS/VAC4EU) • C4591024 (former Safety and immunogenicity in high-risk adults) See Section II.C of this summary for an overview of the post-authorisation development plan.

Table 71. Missing Information: Use in Patients with Autoimmune or Inflammatory Disorders

Risk minimisation measures	Routine risk minimisation measures: None. Additional risk minimisation measures: No risk minimisation measures.
Additional pharmacovigilance activities	Additional pharmacovigilance activities: • C4591011 • C4591012 • C4591021 (former ACCESS/VAC4EU) • C4591024 (former Safety and immunogenicity in high-risk adults) See Section II.C of this summary for an overview of the post-authorisation development plan.

Table 72. Missing Information: Interaction with other Vaccines

Risk minimisation measures	Routine risk minimisation measures: SmPC section 4.5. Additional risk minimisation measures: No risk minimisation measures.
Additional pharmacovigilance activities	Additional pharmacovigilance activities: • C4591030 (Co-administration study with seasonal influenza vaccine) See Section II.C of this summary for an overview of the post-authorisation development plan.

Table 73. Missing Information: Long Term Safety Data

Risk minimisation measures	Routine risk minimisation measures: None. Additional risk minimisation measures: No risk minimisation measures.
Additional pharmacovigilance activities	Additional pharmacovigilance activities: • C4591001 • C4591007 • C4591010 • C4591011 • C4591012 • C4591021 (former ACCESS/VAC4EU) • C4591038 (former C4591021 substudy) • C4591036 (former PHN) See Section II.C of this summary for an overview of the post-authorisation development plan.

II.C Post-Authorisation Development Plan

II.C.1 Studies which are Conditions of the Marketing Authorisation

Study	Purpose of the study
C4591001	The objective of the study is to evaluate the safety, tolerability, immunogenicity and efficacy of COVID-19 mRNA vaccine. An imbalance between the vaccine and control groups in the frequency of COVID-19 disease, in particular for severe COVID-19 disease, may indicate the occurrence of vaccine associated enhanced disease. Surveillance is planned for 2 years following Dose 2.
C4591007	To assess the safety, tolerability, immunogenicity, and efficacy of the BNT162b2 RNA-based COVID-19 vaccine candidate against COVID-19 in healthy paediatric subjects.

II.C.2 Other Studies in Post-Authorisation Development Plan

Study	Purpose of the study
C4591009	To assess the occurrence of safety events of interest, including myocarditis and pericarditis, in the general US population (all ages), pregnant women, the immunocompromised and persons with a prior history of COVID-19 within selected data sources participating in the US Sentinel System.
C4591011	To assess whether individuals (all ages) in the US DoD MHS experience increased risk of safety events of interest, following receipt of the COVID-19 mRNA vaccine.
C4591012	To assess whether individuals in the US Veteran's Affairs Health System experience increased risk of safety events of interest, following receipt of the COVID-19 mRNA vaccine.

Study	Purpose of the study
C4591010	To estimate the incidence rates of medically attended safety events of interest (based on the list of AESI) and other clinically significant events among persons vaccinated with the COVID-19 mRNA vaccine and to assess whether these rates elevated relative to estimated expected rates.
C4591015	To assess safety and immunogenicity in pregnant women In addition, exploratory objectives include: (a) To describe the immune response in infants born to breastfeeding maternal participants vaccinated with prophylactic COVID-19 mRNA vaccine during pregnancy. (b) To describe the safety of maternal immunisation in infants born to breastfeeding maternal participants vaccinated with prophylactic COVID-19 mRNA vaccine during pregnancy.
C4591014	To estimate the effectiveness of 2 doses of COVID-19 mRNA vaccine against hospitalisation and emergency department admission for acute respiratory illness due to SARS-CoV-2 infection.
WI235284	To estimate the effectiveness of 2 doses of COVID-19 mRNA vaccine against hospitalisation for acute respiratory illness due to SARS-CoV-2 infection.
WI255886	To estimate the effectiveness of 2 doses of COVID-19 mRNA vaccine against hospitalisation for acute respiratory illness due to SARS-CoV-2 infection.
BNT162-01 Cohort 13	To assess potentially protective immune responses in immunocompromised adults.
C4591024 (former Safety and immunogenicity in high risk adults)	Safety, tolerability and immunogenicity based on representative medical conditions (≥18 years: NSCLC, CLL, in hemodialysis for end-stage renal disease).
C4591021 (former ACCESS/ VAC4EU)	Assessment of potential increased risk of adverse events of special interest (AESI) among individuals (all ages) after being vaccinated with COVID-19 mRNA vaccine. Estimating the time trend, in relation to DHPC letter dissemination, of the proportion of individuals who received real-world clinical assessments for myocarditis/pericarditis following Comirnaty vaccination.
C4591038 (former C4591021 substudy)	To assess the natural history of post-vaccination myocarditis/pericarditis, including recovery status, risk factors, and/or identification of serious cardiovascular outcomes within 1 year of myocarditis/pericarditis diagnosis among individuals (all ages) vaccinated with BNT162b2 as well as individuals not vaccinated with a COVID-19 vaccine.
C4591036 (former Pediatric Heart Network study)	To characterize the clinical course, risk factors, long-term sequelae, and quality of life in children and young adults <21 years with acute post-vaccine myocarditis

Study	Purpose of the study
C4591030 (Co-administration study with seasonal influenza vaccine)	Safety and immunogenicity of COVID-19 mRNA vaccine and quadrivalent seasonal influenza vaccine when administered separately or concomitantly.

ANNEX 4. SPECIFIC ADVERSE DRUG REACTION FOLLOW-UP FORMS

Table of contents

Follow-up forms

Instructions for use:

This Data Capture Aid (DCA) is intended to enable the retrieval of clinical details about potential anaphylactic reactions experienced by an individual following administration of Pfizer-BioNTech COVID-19 Vaccine.

Select questions as needed to obtain any DCA-defined information described below that was not included in the initial report.

AER/Manufacturer Report #: _____

Suspect product: _____

Reported event term prompting special follow-up activities: _____

AE onset date (dd-Mmm-yyyy): _____

Patient Age (e.g., 65 years): _____

Patient Gender: ☐ Male ☐ Female ☐ Not Stated

Race: ☐ White ☐ Black or African American ☐ Native American ☐ Alaska Native ☐ Native Hawaiian ☐ Asian ☐ Other ☐ Refused or Don't Know

Ethnic Group: ☐ Hispanic/LatinX ☐ Non-Hispanic/Non-LatinX

Reporter Information

Name of reporter completing this form *(If other than addressee, provide contact information below):*		
Phone Number:	Fax Number:	Email Address:

1. Product information (Pfizer-BioNTech COVID-19 Vaccine)

Dose	Date (dd-Mmm-yyyy)	Time (24 hr)	Anatomical Site of injection	Route	Batch/Lot number
1st dose					
2nd dose					

Follow-up Questions

Please provide additional details on a separate page if needed and reference the question number.

1. Please describe all the signs and symptoms of the anaphylactic reaction [please also see Section 7]:
(Please include information on vital signs, e.g. blood pressure, oximetry)
Details:

2. Please describe the time course of the anaphylactic reaction:
(Please specify time of onset following vaccination, speed of progression and duration of signs and symptoms)
Details:

3. Did the patient require medical intervention?
☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details (including dates and times of intervention)*
☐ *Adrenaline* ☐ *Corticosteroids* ☐ *Antihistamine* ☐ *IV fluids*
☐ *Oxygen* ☐ *Bronchodilators* ☐ *Other (please specify)*
Details:

4. Was/Is the patient seen in the Emergency Department?
☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
Details:

5. Was/Is the patient hospitalized?
☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details (e.g., date of hospitalization and duration of stay)*
Details:

6. Was/Is the patient admitted to an Intensive Care Unit?
☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
(e.g., date of admission to ICU and duration of stay)
Details:

7. Please provide information on organ involvement

Multiorgan involvement ☐ Unknown ☐ No ☐ Yes → *If Yes, please indicate which organ systems were affected and provide information on the applicable systems below*

☐ Respiratory ☐ Cardiovascular ☐ Dermatological/Mucosal ☐ Gastrointestinal ☐ Other

Respiratory ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **Bilateral wheeze/bronchospasm** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **Stridor** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **Upper airway swelling** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **Respiratory distress** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details – specifically on the following:*
  - **Tachypnoea** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
  - **Increased use of accessory respiratory muscles** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
  - **Recession** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
  - **Cyanosis** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
  - **Grunting** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **Dry cough** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*

Hoarse voice ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
Difficulty breathing (without wheeze or stridor) ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
Sensation of throat closure ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
Sneezing ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
Rhinorrhea ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
Other ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
Details:

Cardiovascular ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
Measured hypotension ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
Shock ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details – specifically on the following:*
Tachycardia ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
Capillary refill time > 3 sec ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
Reduced central pulse volume ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
Decreased level of consciousness ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
Loss of consciousness ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
Other ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
Details:

Dermatological/Mucosal ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
Generalized urticaria (hives) ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
Generalized erythema ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
Angioedema (not hereditary) ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details (e.g. local or generalized)*
Generalized pruritus with skin rash ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
Generalized pruritus without skin rash ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
Generalized prickle sensation ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
Localized injection site urticaria ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
Red and itchy eyes ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
Other ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
Details:

Gastrointestinal ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
Diarrhea ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
Abdominal pain ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
Nausea ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
Vomiting ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
Other ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
Details:

ANY OTHER SYMPTOMS/SIGNS ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
Details

8. Did the event require the initiation of new medication or other treatment or procedure?

☐ Unknown ☐ No ☐ Yes → If Yes, please provide details

Details:

9. Patient's outcome following the potential anaphylactic reaction:

☐ Recovering ☐ Recovered ☐ Not recovered ☐ Unknown ☐ Fatal, Date (dd-Mmm-yyyy): ……

If outcome is fatal, was an autopsy performed? ☐ Unknown ☐ No ☐ Yes → *If Yes, please* provide autopsy findings

Details:

10. Were any of the following laboratory tests or diagnostic studies performed? *Please specify laboratory data with units, date of test, and reference ranges; and please provide printouts and photographs if available:*

Laboratory Test	Date Performed (dd-Mmm-yyyy)	Results with units, if applicable	Reference Ranges, if applicable (or please state if abnormal or elevated/reduced)
☐ Mast cell tryptase			
☐ Immune markers (e.g. total IgE levels)			
☐ Complement activation test			
☐ Hematology			
☐ Clinical chemistry			
☐ Other relevant tests (please specify):_____			

Past Medical History Questions

Please provide additional details on a separate page if needed and reference the question number.

11. Does the patient have a history of any previous allergies to specific products or any conditions indicative of an allergy?

☐ Medication *(please specify)*
☐ Vaccine *(please specify)*
☐ Foods *(please specify)*
☐ Environmental *(please specify)*
☐ Insect bite/sting *(please specify)*
☐ Latex *(please specify)*
☐ Chemical *(please specify)*
☐ Other *(please specify)*
☐ Asthma
☐ Arrythmia
☐ Urticaria
☐ Pruritus
☐ Mastocytosis
☐ Other *(please specify)*

Details:

12. If there is a previous history of any allergies, does the patient take (or have readily available) any specific medication related to this

☐ Adrenaline (Epipen) ☐ Corticosteroid ☐ Antihistamine ☐ Other

Details:

13. Was the patient taking any medications prior to the event being reported?

☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*

Details:

14. Did the patient receive any recent vaccines for any other conditions prior to the event being reported?

☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*

Details:

15. Did the patient receive any recent vaccines for SARS-CoV2 other than Pfizer-BioNTech COVID-19 Vaccine prior to the event being reported?

☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*

Details:

16. Has the patient received any other vaccines around the time of Pfizer-BioNTech COVID-19 Vaccine vaccination?

☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*

Details:

Revision History

Revision	Effective Date	Summary of Revisions
1.0	23-Dec-2020	New DCA

Instructions for use:

This Data Capture Aid (DCA) is intended to capture the available clinical details about the nature and severity of COVID-19 illness experienced, particularly in relation to potential cases of vaccine lack of effect or vaccine associated enhanced disease (VAED).

Select questions as needed to obtain any DCA-defined information described below that was not included in the initial report.

AER/Manufacturer Report #: _____

Suspect product: _____

Reported event term prompting special follow-up activities: _____

AE onset date (dd-Mmm-yyyy): _____

Patient Age (e.g., 65 years): _____

Patient Gender: ☐ Male ☐ Female ☐ Not Stated

Race: ☐ White ☐ Black or African American ☐ Native American ☐ Alaska Native ☐ Native Hawaiian ☐ Asian ☐ Other ☐ Refused or Don't Know

Ethnic Group: ☐ Hispanic/LatinX ☐ Non-Hispanic/Non-LatinX

Reporter Information

Name of reporter completing this form *(If other than addressee, provide contact information below):*		
Phone Number:	Fax Number:	Email Address:

1. Product information (Pfizer-BioNTech COVID-19 Vaccine)

Dose	Date (dd-Mmm-yyyy)	Site of injection	Route	Batch/Lot number
1st dose				
2nd dose				

Follow-up Questions

Please provide additional details on a separate page if needed and reference the question number.

1. Does the patient have a positive test for SARS-CoV2?

☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details (and indicate if this is a new infection or a recurrence)*
Details: (Please specify date of test and type of test – e.g., nasal swab reverse transcription–polymerase chain reaction (RT-PCR) test or nucleic acid amplification–based test (NAAT) or antigen test)

2. Does the patient have SARS-CoV2 antibodies at diagnosis?

☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
Details: (Please specify date of test, whether IgM /IgG or both and the titer if available)

3. Was/Is the patient hospitalized?

☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details (e.g., duration of hospitalization)*
Details:

4. Was/Is the patient admitted to an Intensive Care Unit?

☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details (e.g., duration of hospitalization)*
Details:

5. Is the patient still hospitalized?

☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details (e.g., duration of hospitalization)*
Details:

6. If discharged, did the patient have SARS-CoV2 antibodies at hospital discharge?

☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
Details: (Please specify date of test, whether IgM /IgG or both and the titer if available)

7. Did the patient display clinical signs at rest indicative of severe systemic illness?

☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details (e.g., Fever, RR ≥30 breaths per minute, HR ≥125 beats per minute, use of vasopressors to maintain BP, SpO2 ≤93% on room air, PaO2/FiO2 <300 mm Hg)?)*
Details:

8. Did the patient require supplemental oxygen (including high flow or ECMO) or receive mechanical ventilation?

☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details (e.g., oxygen requirements, pulse oximetry results)*
Details:

9. Please provide information on any new or worsened symptoms/signs during the COVID-19 illness experienced (including date of onset/worsening)

Multiorgan failure ☐ Unknown ☐ No ☐ Yes → *If Yes, please indicate which organ systems were affected and provide information on the applicable systems below*

☐ Respiratory ☐ Cardiovascular ☐ Gastrointestinal/Hepatic ☐ Vascular ☐ Renal ☐ Neurological ☐ Hematological ☐ Dermatological ☐ Other

Respiratory ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **Dyspnea** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **Tachypnea** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **Hypoxemia** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **COVID-pneumonia** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **Respiratory failure** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **Acute Respiratory Distress Syndrome (ARDS)** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **Other** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*

Details:

Cardiovascular ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **Heart failure** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **Cardiogenic shock** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **Acute myocardial infarction** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **Arrhythmia** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **Myocarditis** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **Other** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*

Details:

Gastrointestinal/Hepatic ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **Vomiting** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **Diarrhea** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **Abdominal pain** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **Jaundice** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **Acute liver failure** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **Other** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*

Details:

Vascular ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **Deep vein thrombosis** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **Pulmonary embolism** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **Limb ischemia** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **Vasculitis** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **Other (in particular any other thromboembolic events)** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*

Details:

Renal ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **Acute kidney injury** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **Renal failure** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **Other** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*

Details:

Neurological ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **Altered consciousness** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **Convulsions/seizures** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **Encephalopathy** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **Meningitis** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **Cerebrovascular accident** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details and indicate if ischemic or hemorrhagic*
- **Other** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*

Details:

Hematological ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **Thrombocytopenia** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details (see also Q14)*
- **Disseminated intravascular coagulation** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details (see also Q14)*
- **Other** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*

Details:

Dermatological ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **Chillblains** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **Erythema multiforme** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*
- **Other** ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*

Details:

OTHER (e.g. multisystem inflammatory syndrome [MIS]) ☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*

Details:

10. Did the patient receive any additional therapies for COVID-19?

Therapy	Date Started (dd-Mmm-yyyy)	Date Stopped (dd-Mmm-yyyy)	Dose/Any additional information
☐ Remdesivir			
☐ Hydroxychloroquine/chloroquine			
☐ Azithromycin			
☐ Corticosteroids			
☐ Other (Please Specify)			

11. Did the event require the initiation of new medication or other treatment or procedure?

☐ Unknown ☐ No ☐ Yes → If Yes, please provide details

Details:

12. Patient's outcome with COVID-19:

☐ Recovering ☐ Recovered ☐ Not recovered ☐ Unknown ☐ Fatal, Date (dd-Mmm-yyyy): .....

If outcome is fatal, was an autopsy performed? ☐ Unknown ☐ No ☐ Yes → *If Yes, please* provide autopsy findings

Details:

13. How many days from the SARS-CoV2 diagnosis did it take before the SARS-CoV2 antigen test became negative?

14. Were any of the following laboratory tests or diagnostic studies performed? *Please specify laboratory data with units, date of test, and reference ranges; and please provide printouts and photographs if available:*

Laboratory Test or Diagnostic Studies	Date Performed (dd-Mmm-yyyy)	Results with units, if applicable	Reference Ranges, if applicable (or please state if abnormal or elevated/reduced)
☐ Test for SARS-CoV-2 by PCR, or other commercial or public health assay			
☐ Imaging for COVID-Pneumonia (e.g.CXR, CT)			
☐ Other radiological investigations (e.g. MRI, angiogram, V/Q scan)			
☐ Imaging for thrombo-embolic events (e.g. doppler or CT)			
☐ Hematology (e.g. leucocyte count [including neutrophil and lymphocyte counts], hemoglobin, platelet count, coagulation parameters [PT, PTT, D-Dimer, INR], fibrinogen, B and T cell function assays)			
☐ Clinical chemistry (e.g. serum creatinine, glomerular filtration rate [GFR], liver enzymes, bilirubin, albumin, B-type natriuretic peptide [BNP], troponin)			
☐ Inflammatory markers (e.g. CRP, ESR, procalcitonin, ferritin, LDH, cytokines [including IL-6])			
☐ Urinalysis			
☐ Evidence of hypoxemia (e.g. PaO_2/FiO_2 [P/F ratio], SpO_2/FiO_2 [S/F ratio]), hypercapnia ($PaCO_2$) or acidosis (pH)			
☐ Other relevant tests (please specify):_____			

Past Medical History Questions

Please provide additional details on a separate page if needed and reference the question number.

15. Does the patient have a history of any of the following?

☐ Hypertension
☐ Diabetes
☐ Heart Disease *(please specify)*
☐ Lung Disease *(please specify)*
☐ Liver disease *(please specify)*
☐ Kidney disease *(please specify)*
☐ Cancer *(please specify)*
☐ Immunosuppressive disorder *(please specify)*
☐ Obesity
☐ Other *(please specify)*

Details:

16. Is the patient a smoker/former smoker?

☐ Current Smoker ☐ Former smoker ☐ No

Details:

17. Was the patient taking any medications routinely prior to the event being reported?

☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*

Details:

18. Have any pre-existing diseases worsened during the SARS-CoV2 infection (please specify)

☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*

Details:

19. Has the patient been treated with immunomodulating or immunosuppressing medications or received any other vaccines around the time of COVID-19 vaccination?

☐ Unknown ☐ No ☐ Yes → *If Yes, please provide details*

Details:
